The *Global status report on road safety 2018* benefited from the contributions of a number of WHO staff and collaborators. Nhan Tran coordinated the writing of the report with contributions by Jeanne Breene, Meleckidzedeck Khayesi, Rob McInerney, Anesh Sukhai, Tamitza Toroyan and David Ward. Kacem Iaych was responsible for data management and statistical analysis; Joëlle Auert was responsible for the legislation data management and analysis. Strategic direction on the report was provided by Etienne Krug.

Regional data coordinators were responsible for trainings, data collection and validation: Anneli Heimann and Martial-Manfred Missimikim (African Region), Alessandra Senisse (Region of the Americas), Rania Saad (Eastern Mediterranean Region and South-East Asian Region), Yongjie Yon (European Region), Maria Angela Pestaño and Whitney Skowronski (Western Pacific Region). Further support at regional level was provided by: Hala Sakr, Dinesh Sethi, Eugenia Rodrigues, Jonathon Passmore, Patanjali Nayar and Jatinder Pal Singh Chhatwal. WHO Representatives and staff at country level facilitated this work and their contribution is gratefully acknowledged. Other WHO staff who contributed include: Elena Altieri, Angelita Ruth Dee, Doris Ma Fat, Colin Mathers, Evelyn Murphy, Florence Rusciano, Zoe Brillantes and Teri Reynolds.

Country level data could not have been obtained without the invaluable input of: the National Data Coordinators (see Table A1 in the Statistical Annex); all respondents who participated in data collection and the country level consensus meetings; government officials who supported the project and provided official clearance of the information for inclusion in this report.

WHO also wishes to thank the following contributors whose expertise made this document possible: Adrienne Pizatella, Jennifer Ellis, Kelly Larson, and Kelly Henning from Bloomberg Philanthropies; Leslie Zellers for her support in reviewing and analysing legislative documents for the region of the Americas; Saul Billingsley, Lotte Brondum, Soames Job, Adnan Hyder, Rob McInerney, and David Ward, for serving on the advisory committee for this report; Abdul Bachani, Judy Fleiter, and Margie Peden, for review comments; Alejandro Furas and Jessica Truong for support on collecting and interpreting data on vehicle standards; Isaac Botchey for assisting with checking of country profiles; Claudia Adriazola-Steil, Matts-Ake Belin and Judy Williams for providing material for boxes; Eric Thuo for assisting with literature review on child restraints; Hal Inada for the checking of references; Kaitlyn Friedman for assisting with data processing; Tony Price who edited the report; the team of translators from Alboum for support with translations of legislation; and graphic designers from Paprika who produced the design and layout of the report.

This report is in memoriam of Dominique Rurangirwa, the National Data Coordinator in Rwanda who lost his life in a road traffic crash earlier this year. His death was most unexpected and he will be sadly missed by all his colleagues, both locally and internationally. This tragedy serves as a reminder of the importance of this work and that more must still be done to strengthen road transport systems to prevent the needless loss of life.

Finally, the WHO wishes to thank Bloomberg Philanthropies for its generous financial support for the development and publication of this report.

Is there anyone we can call for you?

There is a phone call or a knock on the door that we all dread, in which we are told that a loved one has been killed or seriously injured in a road traffic crash.

We shiver as emergency vehicles speed past us on the road to attend a crash. Our hearts miss a beat as we hear about a “road accident” on the news.

But road traffic crashes are not “accidents”. They are completely preventable.

This report shows that the problem is getting worse. Deaths from road traffic crashes have increased to 1.35 million a year. That’s nearly 3 700 people dying on the world’s roads every day.

Tens of millions more are injured or disabled every year, people who suffer life-altering injuries with long-lasting effects. These losses take a huge toll on families and communities. The cost of emergency response, health care and human grief is immense.

There are many reasons for this trend: rapid urbanization, poor safety standards, lack of enforcement, people driving distracted or fatigued, others under the influence of drugs or alcohol, speeding and a failure to wear seat-belts or helmets.

One of the most heart-breaking statistics in this report is that road traffic injury is the leading cause of death for people aged between 5 and 29 years. No child should die or be seriously injured while they walk, cycle or play.

We must return our streets to our children. They have a right to feel safe on them.

In the Sustainable Development Goals, world leaders have committed to halve the number of deaths from road crashes by 2020. This report shows that three years on, far too little progress has been made towards this goal. There is an urgent need to scale up evidence-based interventions and investment.

Development is an opportunity for low- and middle-income countries to avoid the costly mistakes made in the past by high-income countries. We need to create cities and transport systems that reduce reliance on cars. We must apply the lessons we have learned about safe road design. With the right leadership and investment, countries can build in the safeguards and best practices to save lives.

WHO is committed to working with countries to reduce the needless death and disability caused by road traffic crashes.

WHO's General Programme of Work 2019–2023 – our five-year strategic plan – includes road safety goals that are underpinned by 12 voluntary performance targets agreed upon by world leaders last year. These are designed to provide guidance to WHO Member States on key interventions.

It is one thing, of course, to set goals and targets. It's another to achieve them.

Experience shows that sustainable road safety must be planned and requires long-term investment and appropriate management capacity for effective delivery. International organizations, donors and the public and private sectors need to work together to make things happen.

This report highlights the increasing number of countries and cities that are making progress with effective and affordable interventions. My hope is that this report will save lives, prevent injuries and mean fewer emergency responders knock on doors with messages they should never have to deliver.

A handwritten signature in black ink, appearing to read 'Tedros Adhanom Ghebreyesus', with a stylized flourish at the end.

Dr Tedros Adhanom Ghebreyesus
Director-General, World Health Organization

Road safety is an issue that does not receive anywhere near the attention it deserves – and it really is one of our great opportunities to save lives around the world.

The numbers are staggering. Road traffic crashes now represent the eighth leading cause of death globally. They claim more than 1.35 million lives each year and cause up to 50 million injuries. And, the fact is, every one of those deaths and injuries is preventable.

We know which interventions work. Strong policies and enforcement, smart road design, and powerful public awareness campaigns can save millions of lives over the coming decades. To spread those interventions to more countries, it is critically important for partners to target our resources effectively and hold each other accountable for our results.

The data show that low- and middle-income countries bear the greatest burden of road traffic fatalities and injuries. So, over the past decade, Bloomberg Philanthropies has worked closely with the World Health Organization, government agencies, and road safety organizations and invested US\$ 259 million to help implement evidence-based solutions. Together we have promoted the use of helmets and seat-belts, combatted speeding and drunk driving, redesigned city streets to make them safer, and advocated for safer vehicles.

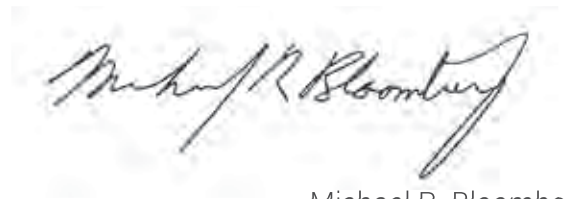

Overall, we have made important policy progress since WHO issued its last road safety report in 2015. Twenty-two countries have amended their road safety laws, bringing them in line with best practices. These laws cover more than one billion people, or 14% of the world's population.

At the same time, we have also focused our intervention efforts on cities. The opportunity for cities is enormous, because they are home to more than half the world's population. And, once cities demonstrate something works, national governments tend to be more willing to scale up a proven solution. To cite just a few leading cities: Accra is using data to improve pedestrian safety, and Ho Chi Minh City is taking cost-effective steps to make more than 150 high-risk intersections safer. Cities in countries such as Brazil and India have reduced traffic crashes, and through media campaigns and stronger enforcement, more cities have cut drunk driving.

These are encouraging trends, and public support for road safety policies is only growing. However, there is still much more work to be done, and Bloomberg Philanthropies will continue to raise awareness of road safety and the need for more action by governments.

Reducing road traffic deaths and injuries is one of the United Nations Sustainable Development Goals – and, given everything we know about the problem and its solutions, that goal is achievable if governments prioritize road safety. WHO is helping to drive the progress we are making, and all of us at Bloomberg Philanthropies thank Dr Tedros, WHO Director-General, his colleagues, and our allies around the world for their continued partnership.

We invite you to learn more about the status of road safety in this important report.

A handwritten signature in black ink that reads "Michael R. Bloomberg". The signature is fluid and cursive, with the first name "Michael" and the last name "Bloomberg" being the most prominent parts.

Michael R. Bloomberg
Founder, Bloomberg L.P. & Bloomberg Philanthropies
WHO Global Ambassador for Noncommunicable Diseases and Injuries

The number of road traffic deaths continues to climb, reaching 1.35 million in 2016. However, the rates of death relative to the size of the world's population has stabilized in recent years. The data presented in this report show that progress has been achieved in important areas such as legislation, vehicle standards and improving access to post-crash care. This progress has not, however, occurred at a pace fast enough to compensate for the rising population and rapid motorization of transport taking place in many parts of the world. At this rate, the Sustainable Development Goals (SDG) target 3.6 to halve road traffic deaths by 2020 will not be met.

Road traffic injury is now the leading cause of death for children and young adults aged 5–29 years, signalling a need for a shift in the current child health agenda, which has largely neglected road safety. It is the eighth leading cause of death for all age groups surpassing HIV/AIDS, tuberculosis and diarrhoeal diseases. The burden of road traffic injuries and deaths is disproportionately borne by vulnerable road users and those living in low- and middle-income countries, where the growing number of deaths is fuelled by transport that is increasingly motorized. Between 2013 and 2016, no reductions in the number of road traffic deaths were observed in any low-income country, while some reductions were observed in 48 middle- and high-income countries. Overall, the number of deaths increased in 104 countries during this period.

Strengthening legislation to mitigate key risk factors is recognized by the majority of governments as an important strategy to improve road safety, as evidenced by the 149 countries that have designated lead agencies with responsibilities that include enacting and assessing traffic laws. While too many countries still lack legislation that appropriately addresses risks such as speeding, drink-driving, the use of helmets, seat-belts and child restraints, since 2014 progress has been made in a number of these areas. Overall 22 additional countries have amended their laws on one or more risk factors to bring them in line with best practice. This translates to an additional one billion people who are now covered by effective road traffic laws.

Of the 175 countries participating in this report, 123 have road traffic laws that meet best practice for one or more key risk factors. During this review period, ten additional countries (45 in total) have aligned with best practice on drink-driving legislation, five additional countries (49 in total) on motorcycle helmet use, four additional countries (33 in total) have aligned with best practice on the use of child restraint systems, and three additional countries (105 in total) on the use of seat-belts. Less progress has been made on adopting best practice on speed limits, despite the importance of speed as a major cause of death and serious injury.

The enforcement of laws and adoption of safety standards — such as the availability of seat-belts and fitments for car occupants in both front and rear seats, remain challenging in many parts of the world. Despite the benefits of vehicle safety measures, only 40 countries have implemented seven or eight of the priority UN vehicle safety standards. There are, however, signs of progress. For example, India, the world's fourth largest car manufacturer, is producing its first four-star (out of a possible five-stars) vehicle and phasing out production of a popular model, which consistently failed safety crash tests.

Some progress is also evident in the planning, design and operation of roads and roadsides, and in the take-up of a range of tools, notably the International Road Assessment Program (iRAP), which is a star rating tool for road networks. One hundred and fourteen countries are currently carrying out systematic assessments or star ratings of existing roads. These assessments and the implementation of appropriate road standards are particularly important as the majority of travel by road users such as pedestrians, cyclists and motorcyclists, occur on roads that are inherently unsafe for them.

There are also some signs of progress in improving access to post-crash care to reduce the consequences and severity of injury once a crash occurs. One hundred and nine countries now have access to a telephone number to contact emergency care and 97 countries have a formal process to train and certify prehospital care providers. More work is needed, however, to ensure access to quality emergency care. Approximately half of all countries have speciality training pathways in emergency medicine and trauma surgery while 78 reported having national or subnational trauma registries in place.

Although the progress towards reducing the number of road traffic deaths has not met global expectations, there are nonetheless signs of improvement. Accelerating the rate of this progress and bringing to scale the benefits of effective legislation, safer vehicles, safer roads, and increasing access to quality emergency care is the main challenge moving forward. There is an urgent need for governments to scale up their road safety efforts in order to live up to their commitments made in the Sustainable Development Agenda 2030. The upcoming Third Global Ministerial Conference on Road Safety in Sweden in February 2020 will be a key opportunity to take a strategic view and set a road safety agenda for the next decade, including setting a new global target on fatalities.

Deaths and injuries resulting from road traffic crashes remain a serious problem globally and current trends suggest that this will continue to be the case in the foreseeable future (1,2). Accelerating progress can, however, be achieved through an integrated approach that includes putting in place and enforcing effective measures such as safety standards for roads and vehicles, legislation to mitigate high-risk behaviours such as speeding, as well as ensuring timely access to professional emergency care (3). Key to this approach is the availability of reliable and comprehensive data on the burden, and risks of road traffic crashes, injuries and deaths to target and monitor progress (4,5).

Without knowledge of the magnitude of the problem and the risks of death and injury, the ability to implement context-specific and appropriate interventions is severely limited. Moreover, as highlighted in previous and current editions of this report, the under-reporting of road traffic deaths is pervasive in many parts of the world and results in a lower priority being given to road safety as compared to other public health challenges (6). Even though the number of people dying annually as a result of road traffic injury surpasses those dying from HIV/AIDS, tuberculosis and diarrhoeal diseases, the political commitment and financial investments in road safety is only a small fraction of that made to combat these diseases (7).

This report is intended to stimulate country actions to improve road safety in countries through the identification of key gaps and opportunities. As we approach the end of the Decade of Action for Road Safety 2011–2020 and the deadline for SDG target 3.6, it is intended to serve as an advocacy tool to generate further political action, as well as a resource to guide implementation by relevant government actors including ministries of health, transport, finance, education, and interior, as well as local authorities in provinces and cities (5,8,9). The specific objectives of this report are to:

- document the annual number of deaths resulting from road traffic injury in order to establish an assessment of progress towards the UN goals for road safety and the Decade of Action;
- review institutional management practices as well as target setting;
- present an analysis of national legislation on key road safety risk factors using best practice criteria;
- summarize the current state of vehicle standards and regulations as well as road infrastructure, and
- examine current progress and challenges in improving post-crash care.

What's new?

The criteria used to determine best practices for legislation have been updated along with the classifications of countries as those with laws that conform to best practice, those with laws that do not conform to best practice, those without laws, and those in which the laws are not applicable. In some instances, new criteria have been introduced based on the latest evidence, to capture the nuanced aspects of road safety legislation in different countries more effectively.

Using the updated criteria, legislation from 2014 (used for the 2015 report) was retrospectively analysed and compared with the analysis of 2017 (used for this report) legislation. Changes (both upgrades and downgrades) have been documented and are presented in the findings of this report. In addition to grouping those countries with laws that conform to best practice, this report also shows which countries have made improvements, which have stayed the same, and which (in a few instances) have made changes that have moved their laws out of alignment with current best practice.

Methods

This series of global status reports on road safety has been developed through an iterative and consultative process with participating Member States. In the first phase, requests for data were sent out through a survey administered in 2017 by the WHO Headquarters to Regional and National Data Coordinators (R/NDC) appointed in each region or country. The self-administered survey contained questions relating to the status of the five pillars of the Decade of Action. With coordination by the NDCs, experts from different sectors within each country discussed and came to an agreement on the responses to the survey questions using information available.

Based on the reported number of road traffic deaths and the source of data, adjustments were made to account for the potential under-reporting due to differences in definitions as well as limitations in the Civil Registration and Vital Statistics (CRVS) in many countries. This process resulted in an estimated number of fatalities, which is presented along with the reported figure. Following this, a final consultation was carried out to allow Member States to respond to any changes that resulted from the verification and validation process. This consultation also provided Member States an opportunity to comment on the WHO estimates for road traffic fatalities, which is often much higher than the official statistics.

Data sources

Three primary sources of data were used in the development of this report: 1) data collected from the self-administered surveys for which responses were received from 175 Member States; 2) data collected through publicly accessible databases, including the UN Economic Commission for Europe database on road traffic conventions, government websites, as well as specialised entities such as the Global New Car Assessment Programme and road inspection data collected by the International Road Assessment Programme to measure the level of safety for different road users; and 3) Global Health Estimates generated by the WHO Department for Information, Evidence and Research. For this report, 2018 data were used for the review of vehicle standards; 2017 data were used for the review of legislation, road standards and post-crash care; fatality estimates were based on data from 2016.

SECTION 1

**CURRENT STATE OF
GLOBAL ROAD SAFETY**

CHAPTER 1

THE GLOBAL BURDEN OF ROAD TRAFFIC DEATHS

Key messages

- The number of road traffic deaths on the world's roads remains unacceptably high.
- Road traffic injuries are the leading killer of children and young adults.
- More than half of global road traffic deaths are amongst pedestrians, cyclists and motorcyclists who are still too often neglected in road traffic system design in many countries.
- There is progress being made, however, it is far from uniform across countries.
- SDG 3.6 target to halve road deaths and injuries by 2020 will not be met without drastic action.

1.35
million deaths each year

8th
leading cause of death for
people of all ages

#1

adults

3
times higher death
rates in low-income
countries than in
high-income countries

Road traffic

The number of road traffic deaths continues to climb, reaching a high of 1.35 million in 2016. However, the rate of death relative to the size of the world's population has stabilized and declined relative to the number of motor vehicles in recent years (10). As shown in Figure 1, despite the increase in absolute numbers, the rate of road traffic deaths has remained fairly constant at around 18 deaths per 100,000 population over the last 15 years. While this does suggest that the problem is not worsening, the world is far from achieving SDG target 3.6, which calls for a reduction in the number of deaths by a half by 2020 (8). Insufficient progress is being made.

Figure 1: Number and rate of road traffic death per 100,000 population: 2000–2016

During the same period the number of vehicles worldwide has steadily increased, while death rates declined from 135 deaths for every 100,000 vehicles in 2000 to approximately 64 deaths for every 100,000 vehicles in 2016 (Figure 2). This represents a reduction of more than 50% in the last 15 years suggesting some progress in mitigating the adverse effects of increasing motorized transport. Although progress has been made, these data show that it has not occurred at a pace fast enough to compensate for rapid population growth and increasing motorization worldwide.

Figure 2: Number of motor vehicles and rate of road traffic death per 100,000 vehicles: 2000–2016

1.35 million people

A leading killer of children

Road traffic injury is the 8th leading cause of death for all age groups, up from the 9th leading cause of death (10). It is also now the leading cause of death for children and young adults aged 5–29 years, signalling a need for a shift in the current child health agenda, which has largely neglected the road safety (11). As progress is made in the prevention and control of infectious diseases, the relative contribution of deaths from noncommunicable diseases and injuries increases (10,11). More people now die as a result of road traffic injuries than from HIV/AIDS, tuberculosis and diarrhoeal diseases (10).

In addition to the injuries and disabilities resulting from road traffic crashes, the safety of roads (or lack thereof) also impacts other public health issues as it contributes to inactivity. People are less likely to walk, cycle, or use public transportation when conditions are unsafe and this has a bearing on other leading causes of death shown in Table 1 (12). These include ischaemic heart disease, stroke, chronic obstructive pulmonary disease, and diabetes, while increasing motorization has also been linked with respiratory illnesses. Simultaneously preventing road traffic deaths and encouraging active travel in safe environments will contribute to reducing the overall burden of preventable deaths.

Road traffic

Table 1: Leading causes of death, all ages, 2016

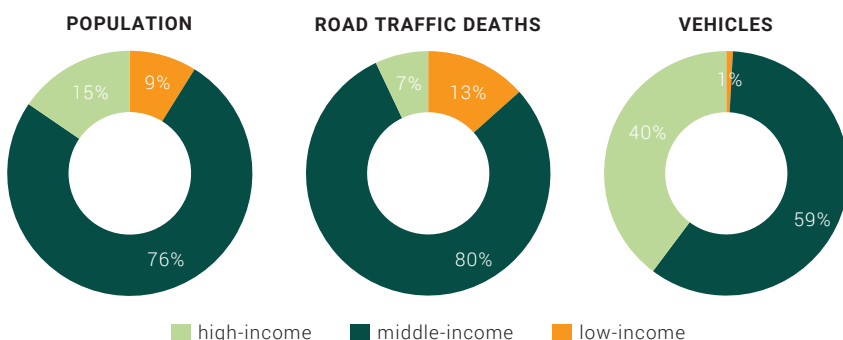

Rank	Cause	% of total deaths
All Causes		
1	Ischaemic heart disease	16.6
2	Stroke	10.2
3	Chronic obstructive pulmonary disease	5.4
4	Lower respiratory infections	5.2
5	Alzheimer's disease and other dementias	3.5
6	Trachea, bronchus, lung cancers	3.0
7	Diabetes mellitus	2.8
8	Road traffic injuries	2.5
9	Diarrhoeal diseases	2.4
10	Tuberculosis	2.3

2016 WHO Global Health Estimates

Progress is not uniform across regions and income levels

Progress in reducing road traffic deaths over the last few years varies significantly between the different regions and countries of the world. There continues to be a strong association between the risk of a road traffic death and the income level of countries. With an average rate of 27.5 deaths per 100,000 population, the risk is more than 3 times higher in low-income countries than in high-income countries where the average rate is 8.3 deaths 100,000 population. As shown in Figure 3, the burden of road traffic deaths is disproportionately high among low- and middle-income countries in relation to the size of their populations and the number of motor vehicles in circulation. Although only 1% of the world's motor vehicles are in low-income countries, 13% of deaths occur in these countries.

Figure 3: Proportion of population, road traffic deaths, and registered motor vehicles by country income category*, 2016

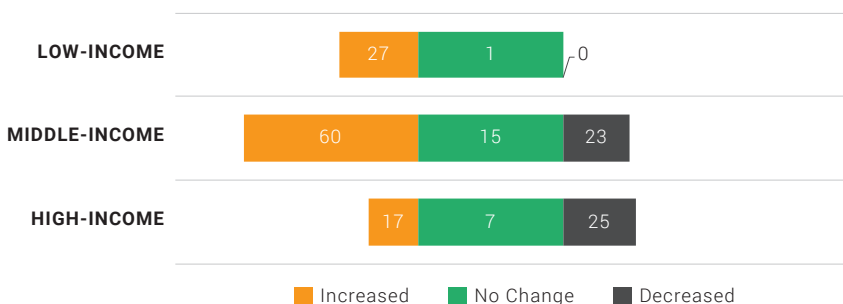

traffic deaths

*income levels are based on 2017 World Bank classifications.

There has also been more progress in reducing the number of road traffic deaths among middle- and high-income countries than low-income countries. As shown in Figure 4, between 2013 and 2016, no reductions in the number of road traffic deaths were observed in any low-income country, while some reductions were observed in 48 middle- and high-income countries. Overall, the number of deaths increased in 104 countries during this period.

Figure 4: Number of countries where a change in the number of road traffic deaths has been observed since 2013*

*These data represent countries that have seen more than a 2% change in their number of deaths since 2013, and excludes countries with populations under 200 000. The income levels are based on 2017 World Bank classifications.

Inequalities across regions

Countries in Africa and South-East Asia have regional rates of road traffic deaths higher than the global rate with 26.6 and 20.7 deaths per 100,000 population respectively. This is followed by countries in the Eastern Mediterranean and Western Pacific, which have regional rates comparable with the global rate with 18 and 16.9 deaths per 100,000 population respectively. Countries in the Americas and Europe have the lowest regional rates of 15.6 and 9.3 deaths per 100,000 people respectively. In terms of progress made, in three of the six regions (Americas, Europe, Western Pacific), the rates of death have decreased since 2013.

traffic death are

Figure 5: Rates of road traffic death per 100,000 population by WHO regions: 2013, 2016

With the exception of the Eastern Mediterranean region, the rate of road traffic deaths per 100,000 population generally decreases as income increases (13). In the Americas, for example, the rate of road traffic deaths among high-income countries is 11.8 per 100,000

population, while it is 18.3 among low-income countries. In Africa there is an observable difference between middle-income countries, which have a rate of death of 23.6 per 100,000 population and low-income countries, where the rate is 29.3 per 100,000 population. At the other end of the continuum, in Europe, the rate of road traffic deaths in middle-income countries (14.4 deaths per 100,000 population) is nearly three times higher than in high-income countries, where there are 5.1 road traffic deaths per 100,000 population.

of all road traffic

Vulnerable road users disproportionately impacted

The variation in rates of deaths observed across regions and countries also corresponds with differences in the types of road users most affected. Globally, pedestrians and cyclists represent 26% of all deaths, with those using motorized two- and three-wheelers comprising another 28%. Car occupants make up 29% of all deaths and the remaining 17% are unidentified road users¹. Africa has the highest proportion of pedestrian and cyclist mortalities with 44% of deaths. In South-East Asia and the Western Pacific, the majority of deaths are among riders of motorized two- and three-wheelers who represent 43% and 36% of all deaths respectively.

Although pedestrians, cyclists and riders of motorized two- and three-wheelers are more vulnerable as a result of being less protected than car occupants, the heavy burden of deaths borne by these road users is also a reflection of infrastructure and vehicle design that prioritizes cars and other motorized transport (14). Despite the prominence of vulnerable road users in many parts of the world, many of whom cannot afford or do not have access to the safest vehicles, they are still largely ignored in the planning, design and operation of roads. In many countries, roads still lack separate lanes for cyclists or adequate crossings for pedestrians and allow motor vehicle speeds that are too high (15). Similarly, while vehicle standards have been developed for car occupants, many are not widely implemented in vehicles sold in low- and middle-income countries. Only recently have more car manufacturers begun to implement standards in high-income countries to ensure that design also protects road users outside of the vehicle (16). The heavy burden of deaths borne by these groups constitutes an issue of equity, as income and social status become social determinants of road traffic deaths and injury (17).

¹ The distribution of deaths among road user categories is based on data reported by countries. In some countries, these data are not available or are incomplete, which contributes to the large percentage of those identified as 'others' or 'unspecified'.

Figure 6: Distribution of deaths by road user type by WHO Region

Box 1: Integrating road safety and urban mobility strategies in Bogotá, Colombia

Bogotá reduced the number of traffic deaths by 50% between 1996 and 2006, by implementing an integrated approach to road safety and urban mobility:

- Strong mayoral leadership was present, which allowed integrated institutional, financial and regulatory reforms, combined with messages that resonated with citizens.
- New investment was undertaken in city infrastructure of around US\$ 2 billion between 1997 and 2006 in over 80 km of Bus Rapid Transport (BRT), nearly 300 km of bikeways and 60,000 m² of improved pedestrian infrastructure. The investment was enabled by institutional and tax reform and a sustainable mobility-oriented response to public demand for improved commuting options.
- Road safety improvements included safer public transport, improved sidewalks and cycle lanes, regulations and their enforcement of seat-belt wearing and drink-driving penalties, reform of the police system, public transport improvement reducing the rate of mode shift to private cars and motorcycles and avoiding exposure to risk.
- In December 2017, Bogotá adopted a new Vision Zero plan, based on the safe system approach, comprising further coordinated, integrated action to proactively reduce deaths and serious injury numbers yet further.

Box 2: Improving the safety of school zones in the Republic of Korea

The Republic of Korea has experienced the 3rd largest decline in the traffic fatality rates among OECD countries since 1972.

A historical focus on transport infrastructure investment and economic development resulted in less emphasis on road safety, particularly on the safety of pedestrians suffering death and injury at the expense of wider, faster roads. To address this problem and with the aim of lowering its high road death rate, the Korean government carried out an analysis of road traffic injury records and the highest risk locations in the network.

A new national strategy was adopted to improve road safety through investments in school zone programmes, improving the regulation of school buses, increasing fines for violations within school zones, clamping down on unregulated school transport, supporting civil society organizations in road safety advocacy and continuously amending and improving road safety legislation. These efforts are reported to have contributed to a 95% reduction in road traffic deaths among children under 14 years of age between 1998 and 2012.

CHAPTER 2

INSTITUTIONAL MANAGEMENT

Key messages

- Achieving global and national road safety goals and targets requires appropriate management capacity.
- Such capacity should be demonstrated through effective institutional leadership within responsible agencies, multi-sectoral coordination arrangements, sustainable funding and data systems to measure, target and monitor progress.
- The inclusion of two SDG targets focused on road safety represents a major milestone for global road safety, confirming it is an essential element of the health and development agenda.
- 12 recently agreed upon global road safety performance targets will help countries to improve their road safety management and assess progress.

132

countries have national strategies for road safety that are funded

109

countries have national targets for the reduction of road traffic deaths

Institutional management provides the foundation for improving road safety (18). The establishment of an appropriately resourced lead agency and coordination arrangements to guide the national road safety effort; the assessment of the state of play and capacity; the setting of goals and targets in road safety strategies; plans and projects; the provision of financial and human resources to address the problem and the monitoring and evaluation of activity are all essential to implementing effective, system-wide interventions (4,18,19).

Among the 175 participating countries, 140 indicated that they have a national strategy for road safety of which 132 reported having strategies that are funded. In addition to having national strategies for road safety, 109 countries reported having a national target for the reduction of road traffic deaths.

traffic deaths.

Similarly, while most countries (161) reported that they have established lead agency arrangements, only 129 reported that these are funded. While many countries reported having funded lead agencies and strategies, the extent of funding was not assessed. Among those with lead agencies, 159 had lead agencies that assumed responsibility for coordination, 144 had lead agencies that assumed responsibility for monitoring the status of road safety, and 149 had lead agencies that also had responsibility for enacting and revising legislation.

Voluntary global road safety performance targets

Against this background and in addition to the continuing provision of international guidance on a range of issues, several notable global developments have taken place since the last report was published, designed to assist countries in focusing their road safety management initiatives.

legislation.

In a call to action at the global level in September 2015, the United Nations General Assembly adopted a series of SDGs as part of the 2030 Agenda for Sustainable Development. The SDGs include specific targets related to road safety shown in Box 3 and their setting represents a major milestone for global road safety, confirming road safety as an essential element of the health and development agenda.

In November 2017, Member States, with the support of WHO, the United Nations Economic Commission for Europe, UNICEF, World Bank and other agencies, reached consensus on a set of 12 Voluntary Global Performance Targets for Road Safety Risk Factors and Service Delivery Mechanisms (Box 4). These voluntary targets provide a framework to guide and monitor the implementation of legislation, the establishment of standards and other interventions to prevent crashes, injuries, and deaths that are highlighted in this report.

Box 3: Sustainable Development Goals for Road Safety (September 2015)

3 GOOD HEALTH AND WELL-BEING

By 2020, to halve the number of global deaths and injuries from road traffic crashes.

11 SUSTAINABLE CITIES AND COMMUNITIES

By 2030, to provide access to safe, affordable, accessible and sustainable transport systems for all, improving road safety, notably by expanding public transport, with special attention to the needs of those in vulnerable situations, women, children, persons with disabilities, and older persons.

Box 4: Global Voluntary Performance Targets for Road Safety Risk Factors and Service Delivery Mechanisms, 2017

TARGET 1
2020

Target 1: By 2020, all countries establish a comprehensive multisectoral national road safety action plan with time-bound targets.

TARGET 2
2030

Target 2: By 2030, all countries accede to one or more of the core road safety-related UN legal instruments.

TARGET 3
2030

Target 3: By 2030, all new roads achieve technical standards for all road users that take into account road safety, or meet a three star rating or better.

TARGET 4
2030

Target 4: By 2030, more than 75% of travel on existing roads is on roads that meet technical standards for all road users that take into account road safety.

TARGET 5
2030

Target 5: By 2030, 100% of new (defined as produced, sold or imported) and used vehicles meet high quality safety standards, such as the recommended priority UN Regulations, Global Technical Regulations, or equivalent recognized national performance requirements.

TARGET 6
2030

Target 6: By 2030, halve the proportion of vehicles travelling over the posted speed limit and achieve a reduction in speed-related injuries and fatalities.

TARGET 7
2030

Target 7: By 2030, increase the proportion of motorcycle riders correctly using standard helmets to close to 100%.

TARGET 8
2030

Target 8: By 2030, increase the proportion of motor vehicle occupants using safety belts or standard child restraint systems to close to 100%.

TARGET 9
2030

Target 9: By 2030, halve the number of road traffic injuries and fatalities related to drivers using alcohol, and/or achieve a reduction in those related to other psychoactive substances.

TARGET 10
2030

Target 10: By 2030, all countries have national laws to restrict or prohibit the use of mobile phones while driving.

TARGET 11
2030

Target 11: By 2030, all countries to enact regulation for driving time and rest periods for professional drivers, and/or accede to international/regional regulation in this area.

TARGET 12
2030

Target 12: By 2030, all countries establish and achieve national targets in order to minimize the time interval between road traffic crash and the provision of first professional emergency care.

- PILLAR 1: Road safety management
- PILLAR 2: Safer roads and mobility
- PILLAR 3: Safe vehicles
- PILLAR 4: Safe road users
- PILLAR 5: Post-crash response

Following the request of the United Nations General Assembly, on November 22, 2017 Member States reached consensus on 12 global road safety performance targets. For more information: http://www.who.int/violence_injury_prevention/road_traffic/road-safety-targets/en/

Box 5: Managing by objectives in Sweden

Sweden is a global leader in road safety performance with 2.8 deaths per 100,000 inhabitants. Between 1990 and 2015, the number of road traffic deaths decreased by 66%. Experience in Sweden illustrates how better results can be achieved through long-term, perennial planning of systematic, evidence-based approaches to intervention, supported by a strong institutional delivery including leadership, sustained investment and a focus on achieving ambitious road safety goals and targets across government, business and civil society.

In October 1997 the Swedish Parliament adopted Vision Zero - a new long-term goal and a new strategic framework for road safety, which many countries are now adopting. The goal, supported by interim targets and objectives, follows the public health approach of preventing deaths and serious injury in road traffic crashes. The strategy is to create shared responsibility for the better management of all parts of the road traffic system in order to address known common errors and human vulnerabilities and thus avoid severe crash outcomes.

As with the 12 voluntary global targets set in 2017, the aim is to provide focal points for meaningful, shared, multisectoral activity at national, regional and local levels. The Swedish objectives target progress to 2020 and include safe road infrastructure at national and municipal levels, a higher proportion of undivided roads with an 80 km/h speed limit and median barriers, more municipal roads with footpaths and cycle paths, better compliance with speed limits, sober driving, seat-belt use, helmet use, higher car safety ratings and a higher share of motorcycles equipped with anti-lock braking systems.

CHAPTER 3

LEGISLATION AND
ROAD USER BEHAVIOUR

Key messages

- Enacting and enforcing legislation on key risk factors are critical components of an integrated strategy to prevent road traffic deaths and injuries.
- As measured against best practice criteria, 123 countries representing 6 billion people have laws that meet best practice for at least one of the five key behavioural risk factors.
- Despite the progress made in improving legislation across the five key risk factors, enforcement remains a major challenge in most countries.

123

countries have laws that meet best practice for at least one of the five key behavioural risk factors

22

countries made improvements to bring their laws into alignment with best practice on one or more risk factors

46

countries have speed laws that align with best practice

45

countries have Xin_ driving laws that align with best practice

49

countries have helmet laws that align with best practice

105

countries have seat-belt laws that align with best practice

33

countries have child restraint laws that align with best practice

1 billion people

Enacting and enforcing legislation on key risk factors including speed, drink-driving, motorcycle helmet use, use of seat-belts and child restraint systems, are critical components of an integrated strategy to prevent road traffic deaths in countries (4,19–24). Legislation, together with standards and compliance regimes for the licensing and disqualification of drivers and riders, needs to be aligned with enforcement, media campaigns and, in some cases, in-vehicle measures such as the availability of seat-belts and fitments, to be effective (25). Police enforcement initiatives need to be swift, frequent and sustained over a long period of time to increase the perceived risk of being caught and punished but also random and widespread to increase the chance of detection. Given the multisectoral nature of road safety, laws and enforcement standards are set by several government agencies, including public health, transport, internal affairs, science and technology, and occupational health and safety, and these require a coordinated effort across sectors (3).

Legislation on key risk factors from participating countries has been reviewed against best practice criteria in order to identify gaps and opportunities for improvement. Currently, 123 countries, representing nearly 6 billion people, have laws that meet best practice for at least one of the five key behavioural risk factors. As shown in Table 2, 45 countries have laws meeting best practice for one risk factor; 31 have laws meeting best practice for two risk factors; 22 have laws meeting best practice on three risk factors; 20 have laws meeting practice on four risk factors; and only five countries have laws that meet best practice for all five key risk factors: speeding, drink-driving, use of motorcycle helmets, use of seat-belts, and use of child restraints.

Table 2: Number of countries and populations covered by laws meeting best practice

Number of risk factors covered by laws	Number of Countries	Total Population covered
1 risk factor	45	1,385,220,916
2 risk factors	31	1,980,475,253
3 risk factors	22	2,131,299,369
4 risk factors	20	347,434,370
5 risk factors	5	144,317,185
Total	123	5,988,747,093

*speeding, drink-driving, use of motorcycle helmets, use of seat-belts, use of child restraints

Since 2014, 22 countries have amended their laws on one or more key risk factors to bring them in line with best practice, covering a potential additional one billion people or 14% of the world's population. As shown in Figure 7, some improvement was made for each of the five behavioural risk factors with the largest improvement found for drink-driving laws (ten countries), followed by motorcycle helmet laws (five countries), child restraints (four countries), and seat-belts (three countries). As a result of one country aligning with best practice and one making changes that brought it out of alignment with best practice, the number of countries with laws aligning with best practice for speed remained the same. Despite the progress made in improving legislation across the five key risk factors, enforcement remains a major challenge in most countries. Only one-third of countries rated their enforcement as "good" (eight or above on a scale of zero to ten, as rated by respondents) for any of the risk factors, indicating that many of these countries are not reaping the full benefit of their legislation.

Figure 7: Countries with laws meeting best practice on 5 risk factors, 2014, 2017

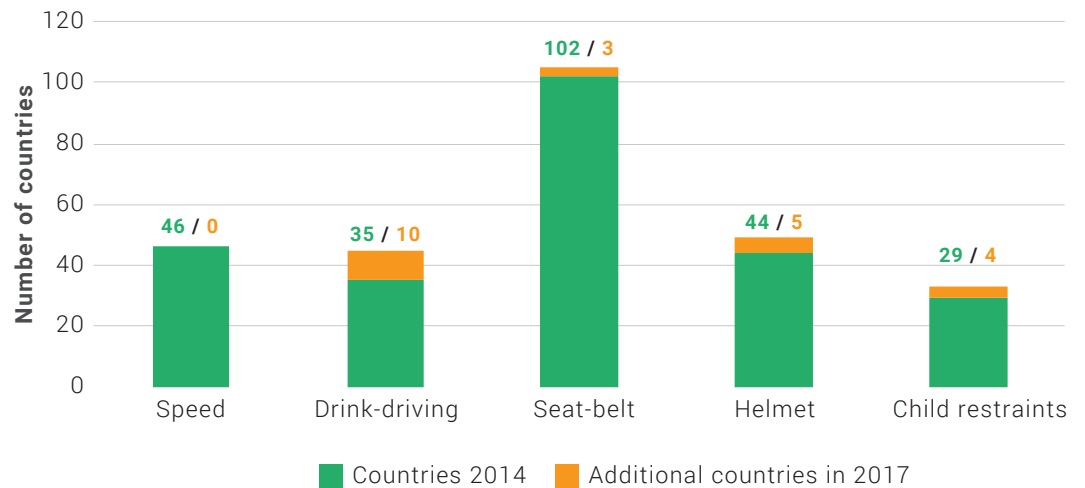

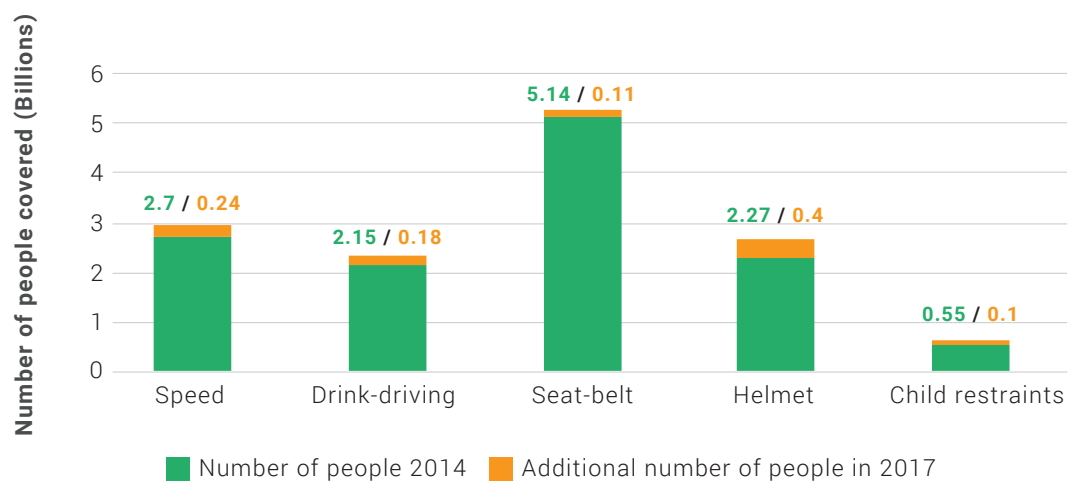

Figure 8: Populations covered by laws meeting best practice, 2014, 2017

The speed at which a vehicle travels directly influences the risk of a crash as well as the severity of injuries, and likelihood of death resulting from that crash (26). Effective speed management is, as such, central to most intervention strategies. The setting and enforcement of speed limits represents a key component of comprehensive speed management as part of an integrated approach involving consideration of the protective quality of roads, roadsides, vehicles and human tolerance thresholds for death and serious injury (3). Even small reductions in speed affect fatal and serious crash risk and the effectiveness of road and vehicle interventions to prevent death and serious injury (19,27).

- An accepted principle is that every 1% increase in mean speed produces a 4% increase in the fatal crash risk and a 3% increase in the serious crash risk (28).
- A 5% reduction in average speed can reduce the number of fatalities by 30% (27).

Small reductions in speed also influence thresholds for death and serious injury risk in different crash scenarios:

- For pedestrians hit by car fronts, the death risk rises rapidly (4.5 times from 50 km/h to 65 km/h) (29).
- In car-to-car side impacts the fatality risk for car occupants is 85% at 65 km/h (30).
- For belted occupants in the best designed cars (Euro NCAP 5-star), the threshold for severe and fatal injury have been identified as 70 km/h (travel speed at impact) in head-on car-to-car crashes (30).

3 billion people

Review of speed laws

Three best practice criteria were used in the assessment of legislation on speed laws:

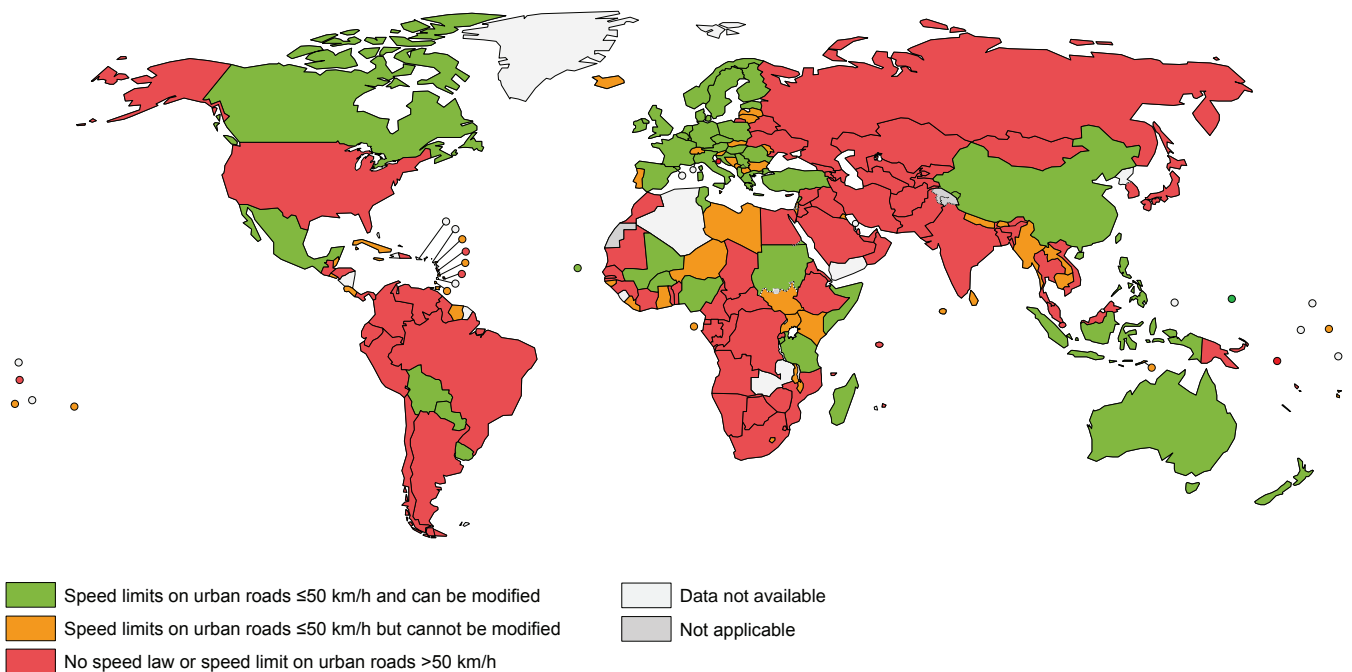

- presence of a national speed limit law;
- urban speed limits not exceeding 50 km/h (based on research, lower limits are recommended for urban areas and 30 km/h for residential areas and areas with high pedestrian activity); and
- local authorities having the power to modify speed limits (to adapt to different contexts).

The results show that 169 countries (representing 97% of the world's population) have set national speed limit laws, however, only 46 of these countries have laws that meet all three best practice criteria. Since 2014, one additional country aligned its legislation with best practice and one country made changes that resulted in the legislation no longer aligning with best practice on speed management. Among countries with legislation meeting at least one of the three best practice criteria, 95 countries provide for speed limits equal to or under 50 km/h in urban areas, and 84 provide local authorities with the power to modify speed limits in their laws. As shown in Figure 9, the presence of best practice laws was found to be more common among high-income countries (50%) than middle- or low-income countries (37% and 13%, respectively).

Enforcement campaigns play an important role in ensuring respect for and compliance with speed limits (31). Combinations of both manual and automated enforcement methods can increase the probability of detecting violations (31). Automated enforcement (such as fixed camera and mobile in-vehicle fitted devices) systems are highly cost-effective and an important consideration especially for low-resource settings (32). A total of 157 countries reported conducting speed enforcement activities. Despite the fact that 90

of the 157 countries indicated that they do employ some automated methods, for the majority of countries, manual speed enforcement remains the dominant method of enforcement. As such, it is not surprising that only 30 countries rated their enforcement of speed laws as “good” (eight or above on a scale of zero to ten).

Figure 9: Countries with speed laws meeting best practice, 2017

Box 6: Setting urban speed limits in Thailand

Setting speed limits appropriate to road function, layout and design and which take account of the safety needs of all creates a framework for safe road use. Typically, maximum speed limits across the network are set at national level on the initiative of roads and transport authorities.

Thailand's current urban speed law was established in 1979 and sets a maximum speed of 80 km/h for urban areas. The 80 km/h limit on urban roads is far from aligning with current best practice, which recommends a maximum speed limit for urban areas of 50 km/h and lower limits in areas where pedestrian volumes are high, such as residential or city streets.

Since 2015, efforts have been made to amend the national speed legislation but were unsuccessful. In 2015, the focus shifted from changing the national legislation to empowering and encouraging provinces to use the provision in the law to set their own speed limits. Additionally, guidelines have been provided for local governments to set appropriate speed limits.

In 2017, with guidelines in place for setting speed limits in municipalities, provinces have started to set more appropriate speed limits, and by September 2018, half of the 76 provinces have set urban speed limits not exceeding 50 km/h.

This example illustrates the importance of local initiatives in moving towards appropriate urban speed limits, when national speed limit setting fails to move in line with best practice.

Sources:
Ministerial Regulation Number 6 (1979).
Guidelines for Setting Speed Limits in City and Municipality

It is estimated that between 5% and 35% of all road deaths are reported as alcohol-related (33,34). Driving after drinking alcohol significantly increases the risk of a crash and the severity of that crash (35). Any amount of alcohol has been shown to impair driving behaviour, and there is a rapid and exponential increase in risk for levels exceeding 0.05 g/dl for the general driving population. Reducing blood alcohol concentrations (BAC) from 0.1 g/dl to 0.05 g/dl may contribute to a reduction of 6–18% in alcohol-related road traffic fatalities (36).

While BAC limits provided for in legislation need to be at the core of efforts to address drinking and driving, an integrated approach to intervention involves combined publicity and high visibility police enforcement and the fitment of alcolocks in commercial and public transport vehicles (3,37). It is best practice to set limits of 0.02 g/dl for young and novice drivers in view of their greater susceptibility to impairment by alcohol at lower levels and their disproportionately higher risk of being involved in fatal crashes; though not included as a best practice criteria for this analysis, the setting of a lower limit of 0.02 g/dl has also been considered for commercial drivers due to the fact that they transport passengers and the potential deaths and injuries inflicted by truck collisions is greater than other passenger vehicles (6,38).

2.3 billion people

Review of drink-driving laws

Three best practice criteria were considered for the assessment of drink-driving laws:

- presence of a national drink-driving law;
- BAC limit for the general population not exceeding 0.05 g/dl; and
- BAC limit for young and novice drivers not exceeding 0.02 g/dl.

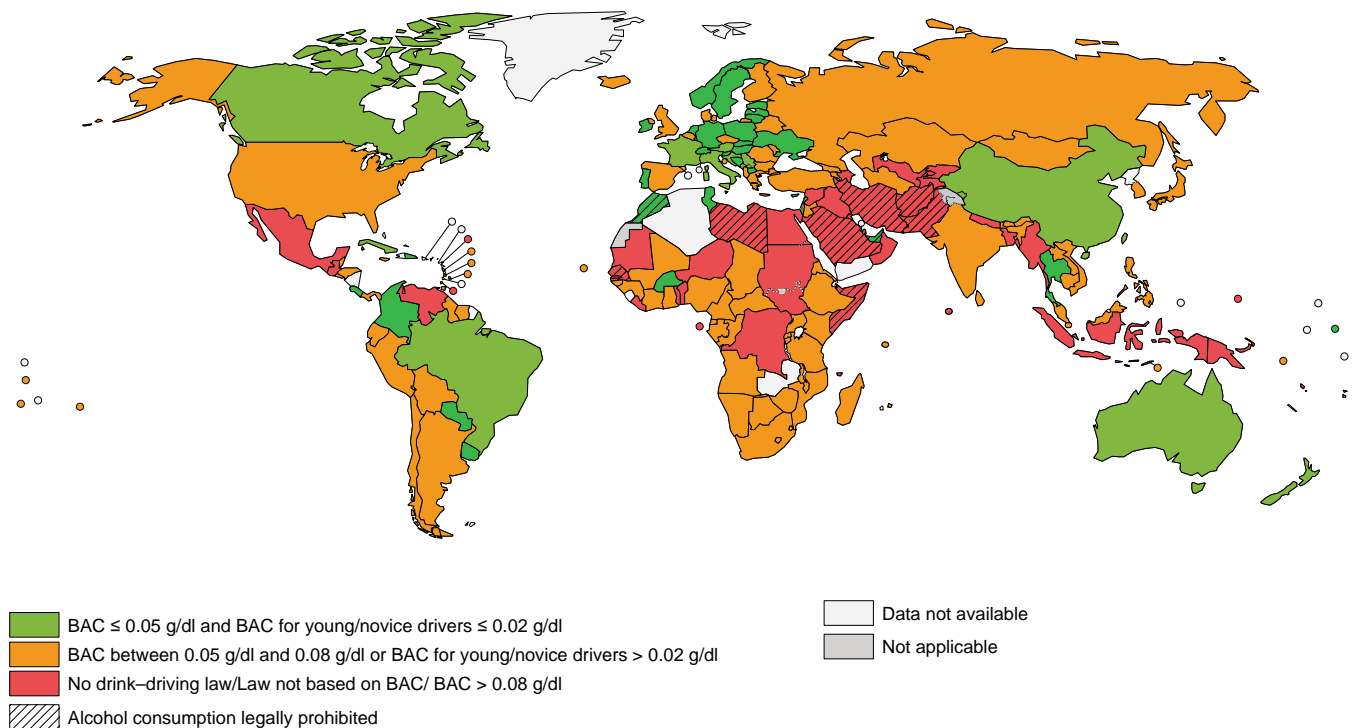

While nearly all of the participating countries have national drink-driving laws in place, not all specify a BAC limit which makes it difficult to enforce the law. Of the 174 with laws, 136 countries provide for BAC threshold limits. Among these, 45 countries meet all three best practice criteria for drink-driving laws with specified thresholds for both the general population (0.05 g/dl) as well as for young and novice drivers (0.02 g/dl). Of those countries with laws that meet at least one of the best practice criteria, 89 countries specify the recommended BAC limit of 0.05 g/dl for the general population; 48 specify a BAC limit of 0.02 g/dl for young and novice drivers; while 53 have provisions for reduced limits of 0.02 g/dl among commercial drivers.

Progress has been made since 2014 with an additional ten countries now meeting overall best practice for drink-driving laws, representing coverage of an additional 180 million people. As shown in Figure 10, more high-income countries (58%) have laws that meet overall best practice criteria for drink-driving than middle-income countries or low-income countries (40% and 2%, respectively). Whereas 60% of countries with laws meeting best practice are from the European region only 2% are from the African region.

Enforcement that incorporates random breath testing strategies (as opposed to those that are targeted during certain times and in certain areas) is more effective in increasing both the perceived and actual probability of being caught and so deterring drinking and driving (38). This review showed that more than half of all countries undertake year round random breath testing

Data on drink-driving remains limited in many countries and is necessary to understanding the magnitude of the problem as well as to evaluate the impact of efforts to prevent it. Of those surveyed, 94 countries have data on road traffic deaths, which involve alcohol consumption amongst drivers, mostly high- and middle-income countries and only five low-income. Estimates for many countries are based on data from crash reports that generally underestimate the extent of the problem. 125 countries reported that fatally injured drivers are tested for alcohol of which 72 reported that the testing is routinely carried out for all cases.

Figure 10: Countries with drink-driving laws meeting best practice. 2017

Box 7: Effectiveness of changing legal blood alcohol concentration limits in Brazil

Brazil's first drink-driving law based on BAC limits was enacted in 1998 making it an offence to drive with a BAC in excess of 0.06 g/dl. A study of road fatalities in Sao Paulo, Brazil found that 39% of people killed in road traffic crashes had BAC levels greater than 0.01 g/dl and 42% of drivers presented had BAC levels greater than 0.06 g/dl. In order to tackle this public health threat, the Brazilian government enacted the new "Dry Law" in June 2008, which reduced the legal BAC limit from 0.06 g/dl to 0.02 g/dl.

Monitoring in the capital and State of Sao Paulo between 2001 to 2010 indicated that the new law resulted in significant reductions in injuries and fatalities. The effect was stronger for fatalities (a decrease of -7.2% and -16.0% in the average monthly rate in the State and capital of Sao Paulo, respectively) than for injuries (-1.8% and -2.3%).

While the new law resulted in casualty reduction, barriers to its application remained. Notably, drivers had a right to refuse a BAC test, which made it difficult to impose criminal sanctions related to BAC test levels. The Brazilian government subsequently amended the "Dry Law" in December 2012 to allow police officers to use alternative evidence (e.g. clinical signs or videos) to support a drink-driving offence. The amendment also made it illegal to have any measurable alcohol in the blood and doubled the original 1998 fines.

2.7 billion people

Between 2013 and 2016, the number of two- and three-wheelers in circulation on the world's roads increased by 10%. In the ten countries with the greatest numbers of these vehicles, motorcycles comprise more than 70% of the national vehicle fleet.

Head injuries are the leading cause of death and major trauma for two- and three-wheeled motor vehicle users (40). Correct helmet use can lead to a 42% reduction in the risk of fatal injuries and a 69% reduction in the risk of head injuries (41). The use of helmets is, as such, an important means of preventing road traffic deaths. Legislation should provide for helmet use by all passengers, including children, and should be supported by public awareness campaigns and sustained enforcement. Good helmet design and correct use of standard helmets when riding a motorcycle are highly important (42,43).

Review of motorcycle helmet laws

Five best practice criteria were considered for the assessment of motorcycle helmet laws:

- presence of a national motorcycle helmet law;
- law applying to both drivers and passengers;
- law applying to all road and engine types;
- law specifying that helmets should be fastened; and
- law referring to / specifying a standard for helmets.

As shown in Figure 11, of the 167 countries that have mandatory helmet laws for motorcyclists, only 49 (representing 36% of the world

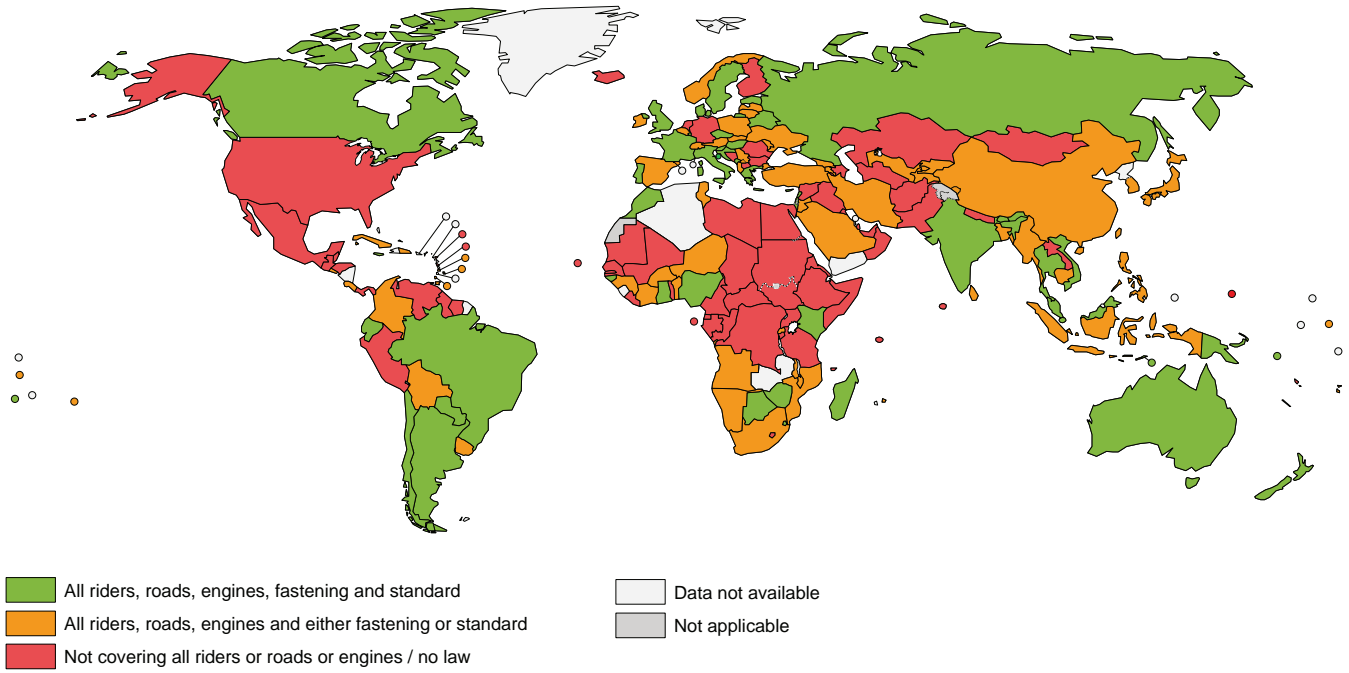

population) have laws that meet all five best practice criteria. Among those with laws that meet at least one best practice criteria, 160 have laws to protect all riders (drivers and passengers); 82 have laws requiring helmets to be fastened; and 93 refer to helmet standards in their laws.

Since 2014, five countries have made amendments to existing legislation to align them with best practice, providing coverage to an additional 397 million people. Despite the prevalence of motorcycles in low-income settings, only 6% of the countries with laws meeting best practice criteria are low-income countries. Only 63 countries, representing 33% of the world's population, restrict child passengers on motorcycles.

Enforcement of helmet-wearing laws are generally weak; only 61 countries rate their enforcement of helmet-wearing laws as "good" (eight or above on a scale of 0 to 10). Similarly, less than half of countries surveyed (75) have data available on helmet-wearing. The majority of these countries are high-income countries; only six low-income countries reported having data on helmet-wearing. Even when it is collected, available data vary largely in terms of quality and methodologies used and very few report on national data.

Figure 11: Countries with helmet laws meeting best practice, 2017

5.3 billion people

Wearing a seat-belt reduces the risk of death among drivers and front seat occupants by 45 - 50%, and the risk of death and serious injuries among rear seat occupants by 25% (35). Mandatory seat-belt legislation is highly effective in promoting seat-belt wearing and is a cost-effective means of reducing road traffic deaths and injuries, especially in rapidly motorizing low- and middle-income countries (44). As is the case for other risk factors, increasing seat-belt use requires multisectoral action beyond the setting of appropriate legislation (45). This includes combined publicity and enforcement and the provision of in-vehicle seat-belt reminders, which have been shown to be highly effective in increasing use (45).

Review of seat-belt laws

Two best practice criteria were considered for the assessment of seat-belt legislation:

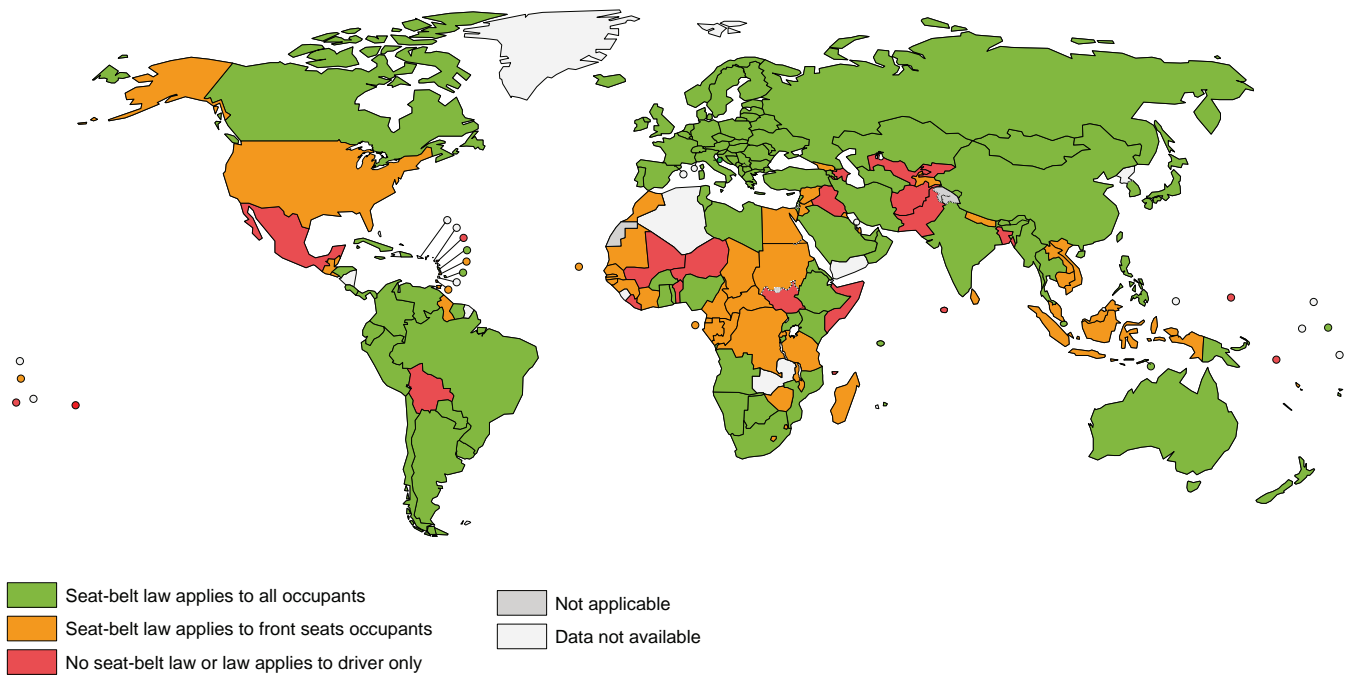

- presence of a national seat-belt law; and
- law applying to front and rear seat occupants.

As shown in Figure 12, of the 161 countries with national seat-belt laws, 105, representing 71% of the world's population, have adopted the best practice of mandating the use of seat-belts by both front and rear seat occupants. Only 7% of countries with seat-belt laws meeting best practice are low-income countries.

Since 2014, seven countries have made changes to their seat-belt legislation: five additional countries now have laws that meet best practice while two countries have made changes that bring their laws out of alignment with best practice. The net increase of 3 countries accounts for an additional 113 million people covered by

best practice seat-belt laws. Enforcement of seat-belt laws is poor with only 40 countries rating their enforcement of seat-belt use laws as “good” (eight or above on a scale of zero to ten). Less than half of countries collect data on seat-belt wearing and the majority of these are high- and middle-income countries.

Figure 12: Countries with seat-belt laws meeting best practice, 2017

**652 million
people**

Child restraints are highly effective in reducing injury and death to child occupants (45–59). The use of child restraints can lead to at least a 60% reduction in deaths (54). The benefits of child restraints have been shown to be greatest for younger children, particularly those under four years of age (49). For children 8-12 years, booster seat use has been associated with a 19% reduction in the odds of injury compared to using a seat-belt alone (48). The position of children in either front or rear seats is also important as a higher risk for injury is associated with the front seating position (59).

Review of child restraint laws

Best practice criteria for child restraints have been further developed since the previous report in view of the additional data collected for this review. Four best practice criteria were considered in the assessment of child restraint laws:

- presence of a national child restraint law;
- requirement for children to use a child restraint at least until ten years of age or 135cm in height;
- restrictions for children under a certain age or height from sitting in the front seat
- reference to or specification of a standard for child restraints.

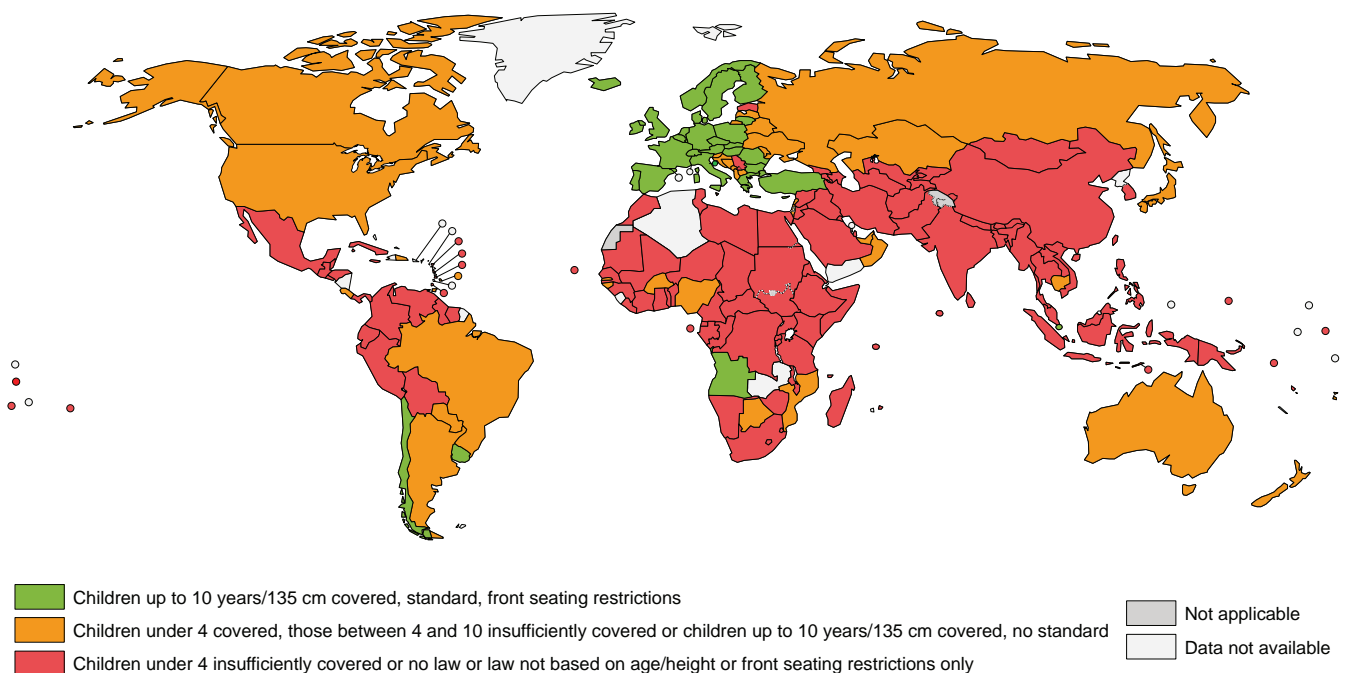

As shown in Figure 13, 84 countries have a national child restraint law. Among these, 33 countries, representing 9% of the world population, meet the overall best practice criteria for child restraints. Of those with laws that meet at least one of the best practice criteria, 53 countries

refer to a standard for child restraints, 113 restrict seating children in the front seat (including 61 banning front seating) and 41 countries address the age and/or height criteria of ten years of age or 135 cm in height in the legislation.

Since 2014, four countries have made amendments to legislation on the use of child restraints to bring them in line with best practice. Among those with laws meeting best practice, 85% are high-income countries and 15% are middle-income countries. No low-income countries have laws on the use of child restraint systems that meet best practice. Best practice laws are most common among countries in the European region; in all other regions, less than 7% of countries have laws on the use of child restraint systems that align with best practice.

Only 22 countries rate their enforcement of child restraint laws as “good” (eight or above on a scale of zero to ten) and only 35 collect data on child restraint use.

Figure 13: Countries with child restraint laws meeting best practice, 2017

Distracted driving by mobile devices such as smartphones and/or other in-vehicle devices is a growing risk factor linked to serious negative outcomes (60–62). The use of a mobile phone while driving is widespread amongst young and novice drivers and growing amongst motorcyclists, adding further to the already high risk of crash and death among these groups. Telephone use while driving (whether hand-held or hands-free) increases the likelihood of being involved in a crash by a factor of four, while texting increases crash risk by around 23 times (63). Driver reaction times have also been shown to be 50% slower with telephone use than without. Similarly, in-car telephone conversations impair drivers more than listening to the radio or talking to passengers (64,65). Despite the growing body of evidence on the risks associated with distracted driving, there remains a dearth of evidence on the effectiveness of interventions to reduce distracted driving.

Review of mobile phone laws

There is insufficient evidence on the effectiveness of legislation to limit or prohibit the use of mobile devices while driving to establish best practice criteria. A total of 150 countries have a national mobile phone law in place and most (145) prohibit the use of hand-held mobile phones while driving. In terms of progress made, four additional countries have national mobile phone laws though the impact of this cannot be assessed at this time as there is currently not a best practice for legislation on distracted driving.

Given the difficulty in detecting these behaviours, enforcement and data collection remain challenging. 64 countries routinely collect data on this risk, largely through regular police crash reports with few regular observational studies. An additional 21 countries have some non-routinely collected data from research.

Though more difficult to quantify than alcohol, the use of illegal drugs and certain prescription medications is increasingly linked to road traffic crashes and deaths, though there are many complexities around testing and establishing the causality of different drugs (66). The concomitant use of drugs and alcohol presents further complexities and risks (66). There is a dearth of data on how frequently drivers use and/or are impaired by drugs and few countries systematically measure the extent of the drug-driving problem. Data from the United States show that among fatally-injured drivers for whom drug test results were available, 43.6% were positive in 2016, an increase from 27.8% in 2006 (67). The risk of crash and death varies depending on the type of psychoactive drug. The use of amphetamines increases the risk for fatal crashes by five times and risk for non-fatal crashes by six times.

Review of drug-driving laws

There is insufficient evidence on the effectiveness of legislation to limit or prohibit drug-driving to establish best practice criteria. The majority of countries surveyed (156) have a national drug-driving law in place. This includes two countries that have adopted laws to prohibit drug-driving since 2014, though the impact of this cannot be assessed at this time as there is currently not a best practice for legislation on drug-driving.

The extent of the drug-driving problem is insufficiently known in many countries. Only 75 reported doing some drug testing among fatally injured drivers.

CHAPTER 4

SAFE ROADS

Key messages

- When safety is taken into consideration during the planning, design and operation of roads, substantial contributions can be made to reducing road traffic deaths and injuries.
- For pedestrians, cyclists and motorcyclists, the lack of specific infrastructure features that can ensure them a safe journey leaves them vulnerable to injury.
- Road safety inspections and the star rating of roads can provide mechanisms to identify failings in infrastructure which can affect a crash likelihood and severity.
- Upgrading high-risk roads and providing access to safe and affordable public transport will reduce road traffic death and injury.

88%

of pedestrian travel is on
1- or 2-star roads

86%

of bicyclist travel is on
1- or 2-star roads

67%

of motorcyclist travel is on
1- or 2-star roads

Road infrastructure is strongly linked to fatal and serious injury causation in road collisions, and research has shown that improvements to the road infrastructure are critical to improving overall road safety (69). The aim is to create a safe road environment, rather than placing the main responsibility for safety on users who fail to deal with the intrinsic dangers of the roads. Head-on crashes, for example, occur on undivided roads while the lack of a footpath or a safe crossing presents a major risk for death and injury to pedestrians (3). For cyclists and motorcyclists, the lack of specific infrastructure features that ensure a safe journey like cycle lanes and motorcycle lanes leaves them vulnerable to impact and injury (69). The provision of affordable and safe public transport as well as facilities for safe walking and cycling are highly important.

Review of the use of standards and tools to improve the safety quality of roads

This report has continued to track the status of countries in setting design standards, undertaking audits and/or the star rating of new road infrastructure and inspection/star rating of existing roads. Three new questions in this report involve:

- ***the use of dedicated funding to upgrade high-risk roads.*** In most countries and cities, more than half of all road deaths and severe injuries happen on less than 10% of the road length (70). The return on investment for improving road infrastructure safety on these high-risk roads is substantial.
- ***design standards that specifically meet the needs of vulnerable road users.*** Historic road design practice and standards have focussed on meeting the capacity and travel time needs of motorized vehicles whereas the specific needs of vulnerable road users have often been secondary considerations.

→ *the provision of affordable and safe public transport.* In urban areas, where an additional two billion people are expected to be living in cities by 2045, the provision of affordable and safe public transport is an essential investment for sustainable mobility.

While design standards exist in most countries, the way in which they are applied to a new road design is influenced by the complexity of the location (urban, rural, utility services, road users present), the priority on safety outcomes and the budgets allocated for the project. This review shows that 112 countries have national design standards for the management of speed. Ninety-two countries have national design standards for separating pedestrians and cyclists road users from motorized traffic. One hundred and thirty-two countries have national design standards for the provision of safe crossings for pedestrians and cyclists.

Road safety inspections and the star rating of existing roads provide a mechanism to identify any existing road design and speed management features that can affect crash likelihood and severity. Systematic risk rate mapping, performance tracking and safety rating

using objective data are carried out by international and national road assessment programmes. (71). Road protection scores assess the level of protection against the risk of death and serious injury in collisions for all main user groups afforded by the road environment. Each road is given a star rating from one to five stars. Minimum star ratings for the infrastructure safety of major roads are increasingly being used in targeted programmes and are recommended, especially where high-quality crash injury data are not yet available or where capacity is still being built for safety engineering (69).

A sample of recent of International Road Assessment Programme (iRAP) assessments from 54 countries, covering 358,000 kilometers of rural and urban roads with over 700 billion vehicle kilometres of travel a year has highlighted that 88% of pedestrian travel is on one- or two-star roads, 86% of bicycle travel is one- or two-star roads, 67% of motorcycle travel is on one- or two-star roads, and 44% of vehicle travel is one- or two-star roads (72). One hundred forty-seven countries reported carrying out road safety audits or star ratings for new roads while 114 countries reported doing safety assessments or star rating on existing roads.

The implementation of a dedicated funding stream and targeted programmes to upgrade high-risk roads and provide access to safe and affordable public transport will help to systematically eliminate the highest-risk roads in a country and reduce death and injury. This review found that 116 countries have a systematic programme in place for targeting and upgrading high-risk locations on existing roads. Additionally, 77 countries reported investing in mass transit while 103 countries reported having formal policies for formal bus/mini-bus systems.

Table 3: Star rating of roads – what makes a road safe?

Star Rating				
★	No sidewalk, No safe crossing, 60 km/h traffic	No cyclepath, No safe crossings, poor road surface, 70 km/h traffic	No motorcycle lane, undivided road, trees close to road, winding alignment, 90 km/h traffic	Undivided road with narrow centerline, trees close to road, winding alignment, 100 km/h traffic
★★★	Sidewalk present, pedestrian refuge, street lighting, 50 km/h traffic	On-road cycle lane, good road surface, street lighting, 60 km/h traffic	On-road motorcycle lane, undivided road, good road surface, >5m to any roadside hazards, 90 km/h traffic	Wide centerline separating oncoming vehicles, >5m to any roadside hazards, 100 km/h traffic
★★★★★	Sidewalk present, signalized crossing with refuge, street lighting, 40 km/h	Off-road dedicated cycle facility, raised platform crossing of major roads, street lighting	Dedicated separated motorcycle lane, central hatching, no roadside hazards, straight alignment, 80 km/h traffic	Safety barrier separating oncoming vehicles and protecting roadside hazards, straight alignment, 100 km/h traffic

* For details on the full model for all road users and more urban and rural examples see <https://www.irap.org//3-star-or-better/what-is-star-rating>.

Box 8: 5-star school journey for Lusaka students

Sub-Saharan Africa has the world's highest road traffic injury rates. For students of Justin Kabwe Primary School in Lusaka, Zambia, their journey to school is now much safer, with access roads raised from one- and two-star dangerous to five-star safety excellence, assessed using iRAP's Star Rating for Schools app. Four children were injured on roads around the school before the school was upgraded. 4,700 vehicles pass the entrance, 200 people cross the road and over 900 people walk along the road past the school every peak hour. Crossing the road into school used to be very dangerous.

Thanks to a project completed in November 2017 by the nonprofit Amend and supported by FedEx, infrastructure enhancements have improved safety, assessed using the Star Rating for Schools (SR4S) app powered by iRAP's Pedestrian Star Rating. The improvements included the addition of a raised platform pedestrian crossing, footpaths, fencing and a school zone warning, removal of vehicle parking which blocked sight lines, and reduced operating speeds of passing vehicles.

Four locations with high pedestrian traffic flows were star rated for safety using the SR4S app before and after the infrastructure improvements. The before and after star rating results captured by SR4S reflected a major improvement in safety. The school's main entrance intersection and nearby corner achieved star rating improvements from one to five stars and two to five stars respectively.

CHAPTER 5

SAFE VEHICLES

Key messages

- Vehicle safety features such as electronic stability control and advanced braking make a substantial contribution to reducing road traffic deaths and injuries.
- Despite these potential benefits, not all new and used vehicles are required to be equipped with these and other internationally recognized vehicle safety standards.
- New Car Assessment Programmes (NCAPs) have proved highly effective in raising levels of vehicle safety significantly above minimum regulatory requirements.

40

countries implement
7 or 8 of the priority
UN vehicle safety
standards

124

countries apply 0 or 1 of
the 8 priority UN vehicle
safety standards

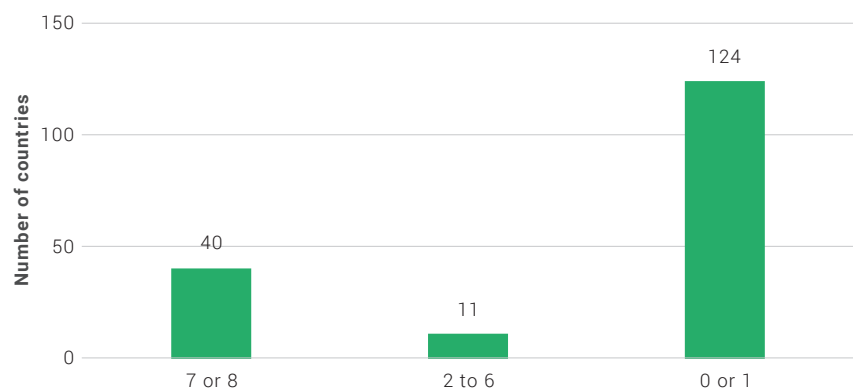

1 billion people

Vehicle safety is increasingly critical to the prevention of crashes and has been shown to contribute to substantial reductions in the number of deaths and serious injuries on the roads (6). Features such as electronic stability control and advanced braking are examples of vehicle safety standards that can prevent a crash from occurring or reduce the severity of injuries (74). Despite these potential benefits, not all new and used vehicles are required to be equipped with internationally recognized safety standards (75). Eight UN vehicle safety standards have been prioritized for implementation by countries (Box 9).

Review of take up of key vehicle safety regulations

As shown in Figure 14, progress with uptake of the eight¹ priority UN vehicle safety standards has been very limited since the last review. To-date, only 40 mainly high-income countries have implemented seven or eight of these standards. Eleven countries apply two to six standards, and 124 apply one or none of the standards. Since the last review, one additional country, India, is applying the front and side impact protection standard. One other country, Malaysia, has applied the electronic stability control regulation from 2018.

Figure 14: Countries implementing priority UN safety standards for vehicles, 2018

¹ In the previous report, 7 priority standards were identified. An additional standard for motorcycle anti-lock braking systems (ABS) has been included in this report.

In relation to the motorcycle anti-lock braking systems (ABS), a number of countries with high usage of motorcycles, are or will be implementing regulations requiring the use of ABS or combined braking systems (CBS) for motorcycles. As shown in Table 4, most of the countries implementing these regulations require ABS systems for vehicles greater than 125cc; China and Brazil only require ABS for vehicles greater than 250cc and 300cc respectively, which means that a large number of motorcycles and e-bikes are excluded from this requirement. With the exception of Brazil, all have provisions to extend the ABS requirements for used motorcycles already in circulation in circulation, requiring them to be retrofitted, as well as for new motorcycles.

Table 4: Motorcycle ABS regulation, 2018

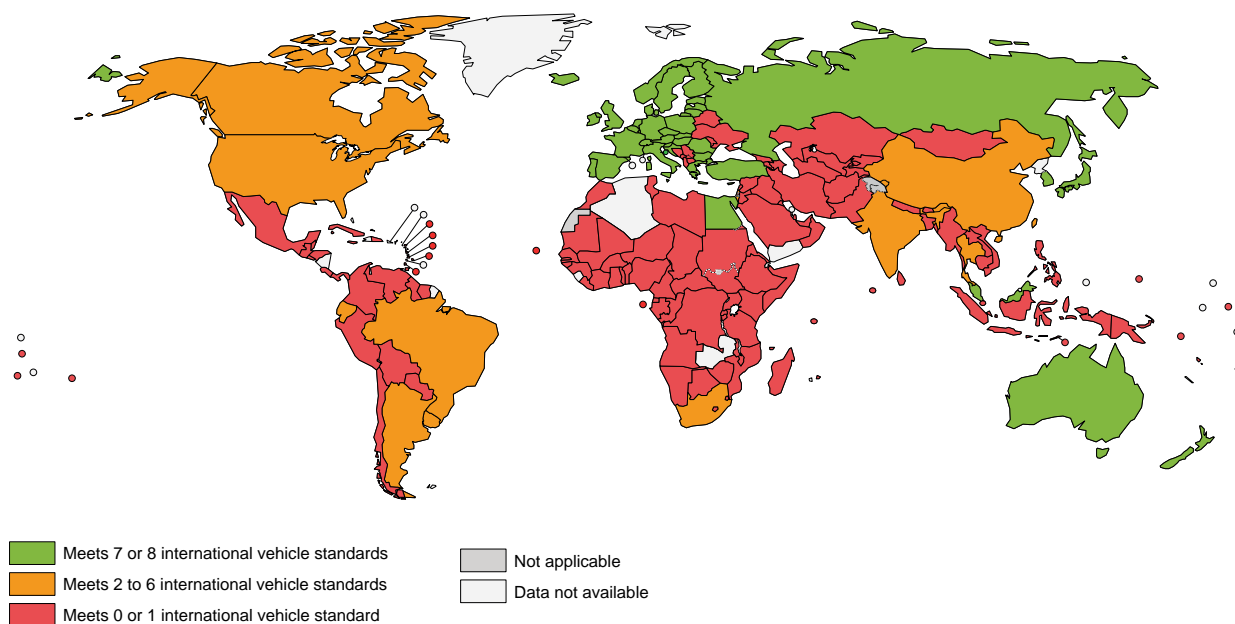

Countries	Motorcycle ABS regulation	Note
EU	YES – for all new types >125cc as of 01/2016 and for all existing types > 125cc as of 01/2017	>50cc can have ABS or CBS fitted
Japan	YES – for all new types >125cc as of 10/2018 and for all existing types > 125cc as of 10/2021	>50cc can have ABS or CBS fitted
India	YES – for all new types >125cc as of 04/2018 and for all existing types > 125cc as of 04/2019	<125cc can have ABS or CBS fitted
China	YES – for all new types >250cc as of 07/2019 and for all existing types >250cc as of 07/2020	>250cc mandatory both front and rear wheel; >150cc and 250cc ABS or CBS
Brazil	YES – for all new types \geq 300cc ramp up from 2016-2019	<300cc can have ABS or CBS fitted; off road bikes excluded
Australia	YES – for all new types > 125cc from 11/2019 and for all existing types >125cc from 11/2021	>50cc can have ABS or CBS

Review of consumer information programme progress:

The UN General Assembly has recommended the implementation of new car assessments as a means of improving vehicle safety (76). New Car Assessment Programmes (NCAPs) have proved highly effective in raising levels of vehicle safety significantly above minimum regulatory requirements. NCAPs typically carry out safety ratings for crashworthiness to promote occupant and pedestrian protection and crash avoidance through crash tests and technology assessments (77).

Figure 15: Countries applying UN vehicle safety standards, 2018

Box 9: Priority UN vehicle safety standards

1–2: Frontal impact protection and side impact protection (R94 and R95): ensure that cars withstand the impacts of a frontal and side impact crash when tested at certain speeds. These crashworthiness regulations help to protect occupants withstand the impact of front and side impact crashes.

3: Electronic stability control (R140): prevents skidding and loss of control in cases of oversteering or understeering and is effective at reducing crashes and saving lives. It is effective in avoiding single car and roll over crashes, reducing both fatal and serious injuries.

4: Pedestrian front protection (R127): provides softer bumpers and modifies the front ends of vehicles (e.g. removes unnecessarily rigid structures) that can reduce the severity of a pedestrian impact with a car.

5–6: Seat-belts and seat-belt anchorages (R14 & R16): ensure that seat-belts are fitted in vehicles when they are manufactured and assembled and that the seat-belt anchor points can withstand the impact incurred during a crash, to minimize the risk of belt slippage and ensure that passengers can be safely removed from their seats if there is a crash.

7: Child restraints (R129): ensure that the child seat is in place with the adult seat-belt and that ISOFIX child restraint anchorage points are fitted to secure the restraint.

8: Motorcycle anti-lock braking systems (R78): help the rider maintain control during an emergency braking situation and reduce the likelihood of a road traffic crash and subsequent injury.

Box 10: Establishing new e-bike standards in China

China, like many other countries, is seeing a surge in the use of e-bikes – some estimates indicate that there are 200 million such vehicles in use nationally, three million of which can be found in Beijing. As the nature of e-bikes has evolved, the existing standards established in 1999 are no longer relevant and as a result, e-bikes sold and used in China are not standardized.

Without an appropriate standard, many vehicles are being manufactured and sold as ‘e-bikes’ when they are essentially motorcycles that are capable of going 40 km/h or faster. However, they are all treated as bicycles and thus helmet requirements and speed limits are not imposed. As such, they use bike lanes and footpaths designed for and used by non-motorised users.

In May 2018 a new standard was issued aiming to improve the regulation of e-bikes and putting an end to the practice of motorcycles passing for e-bikes. This standard is being phased in (commencing in April 2019). Any vehicle that meets the new standard (which is aligned with international practice with a speed limit of 25 km/h) will be considered a bicycle and not subject to registration, licensing or helmet requirements. Those e-bikes not meeting that standard will be treated as motorcycles and subject to helmet laws and licensing requirements. As the majority of e-bikes in circulation are likely to be non-standard, this standard closes a loophole that allowed millions of motorcycle riders to not wear a helmet.

Source: Electric Bicycles-General Technical Requirements GB17761-1999; Electric Bicycles-General Technical Requirements GB17761-2018

Box 11: Vehicle safety standards in India

India is the fourth largest vehicle producer in the world and now applies new vehicle safety standards to passenger cars and motorcycles. In 2014, independent crash tests carried out by Global NCAP's 'Safer Cars for India' initiative revealed that some of India's top selling models would fail the UN's frontal impact crash test. Further Global NCAP tests at a higher speed also resulted in zero-star ratings indicating a high risk of fatal or serious injury.

In 2015 the Indian government announced the application of new regulations consistent with the UN standards for front and side impact and also pedestrian protection. For new car models, the use of front and side crash tests came into force from October 2017 and will apply to all new cars from October 2019. The pedestrian protection regulation for new models came into force from October 2018 and will apply to all new cars from October 2020. In addition, new cars are required to have air bags fitted as standard and to have a speed warning device above 80 km/h.

The combination of the new regulations and the Safer Cars for India project is raising consumer demand for key features such as airbags and acting as a strong catalyst for improved safety design by the automobile industry. New models are now on the market that not only comply with the new standards but also achieve good scores – including a model that achieved four stars in Global NCAP tests that are more stringent. The production of older designs of cars that cannot pass the new crash tests, such as the Tata Nano, which received zero stars in Global NCAP's first round of tests in 2014, is being phased out. The next challenge for India is to accelerate use of electronic stability control which is currently fitted in over 70% of new passenger cars worldwide but to less than 10% of new cars in India.

CHAPTER 6

POST-CRASH CARE

Key messages

- Simple and affordable post-crash care interventions save lives.
- Effective care for the injured requires timely care at the scene, prompt transport to appropriate emergency and surgical care at hospital, and early access to rehabilitation services.
- The proportion of patients who die before reaching a hospital in low-income countries is over twice that in high-income countries.
- Bystanders contribute by activating the emergency care system and taking simple, potentially life-saving actions until professional help is available.

109

countries have a telephone number with national coverage to activate the emergency care

55%

of countries have a formal process to train and certify prehospital providers

45%

of countries have national or subnational trauma registries

A broad and integrated approach to post-crash care can save millions of lives and mitigate the short- and long-term effects of experiencing a crash to help survivors return to function and independence at home and at work (45, 46). Key elements of post-crash care identified in the Decade of Action include structures to allow timely delivery of health services, data to inform policy and support quality care delivery, and legislation to ensure access to emergency care without regard to ability to pay (4).

Building systems to ensure timely care for the injured

Emergency care is at the core of the post-crash response. There is a series of time sensitive actions that are essential to provide effective care for the injured, beginning with activation of the emergency care system and continuing with care at the scene, transport, and facility-based emergency care. Rehabilitation – both in hospital and beyond, is essential to maximise the impact of emergency and surgical care and to limit the physical and psychological impact of injuries (18). Ideally, countries should designate a lead government agency with the authority to set system-wide standards and to coordinate prehospital and hospital-based care for the injured.

Role of bystanders in the emergency care system

Even the most sophisticated emergency care system is ineffective if bystanders fail to recognize a serious injury or do not know how to call for help. Bystanders contribute by activating the emergency care system and taking simple, potentially life-saving actions until professional help is available (80–82). To facilitate the important contribution of bystanders it is important that there is legislation in place to protect those who assist the injured. WHO's Emergency Care System Assessments, carried out in over 30 countries worldwide,

found that many countries have no bystander protection laws or limited enforcement, and many countries report that those who assist the injured experience a range of serious financial, legal and social consequences.

To activate the emergency care system, ideally there should be a single telephone number that is valid throughout the country, easy to remember and available as a free call (6,80,83). This current report found that 109 countries have a telephone number with full national coverage. Among the countries that have conducted the WHO Emergency Care System Assessment, several report that less than half the population know the emergency care access number by memory.

Care at the scene

The proportion of patients who die before reaching a hospital in middle-income countries is over twice that in high-income countries (84). Despite the enormous potential impact of prehospital care, the current report shows that 55% of countries have a formal process to train and certify prehospital providers. In addition, the WHO Emergency Care System Assessments data show that most countries report either no ambulances available to travel to the scene of the crash or that the number of ambulances available is grossly inadequate to meet population needs. It is important to recognise that while the optimal system may be one that can quickly dispatch equipped ambulances with trained providers to the scene of the injury, there are many ways to improve care at the scene of a crash (3,80). For example, simple systems using mobile phones and targeted training of key lay groups (e.g. community leaders, police, and professional drivers) to provide basic interventions can bridge to professional care and improve outcomes (3,80).

Hospital-based emergency care for the injured

Even short delays to care for the injured can mean lives lost. The WHO Emergency Care System Assessments have found that first-level hospitals in many countries lack dedicated emergency units altogether. Where these units exist, many lack essential equipment for diagnosis and treatment of injuries, and few have the protocols and checklists needed to ensure a systematic approach to every injured patient. They are often staffed only by providers working on a rotational basis who may or may not have the benefit of dedicated training in the care of emergencies: indeed, this report found that just more than half (54%) of countries have speciality training pathways in emergency medicine and trauma surgery.

Beyond a staffed and equipped emergency unit, any facility that is certified to care for the seriously injured should have 24-hour access to operative and critical care services. However, most countries who have conducted the Emergency Care System Assessment report that less than a quarter of the population overall would be able to access a staffed operating theatre within two hours of serious injury. In addition, all assessed countries report inadequate numbers of qualified rehabilitation providers and long delays in accessing community-based rehabilitation services.

Data and information to guide post-crash response

Systematic hospital-based data collection is critical to both clinical quality improvement activities and targeted planning and prevention initiatives. Trauma registries are case-based databases that gather information on injury epidemiology, clinical interventions and health outcomes in order to identify and address specific gaps in care. In both high- and limited-resource settings, registries have been shown to

improve the quality of care and clinical outcomes, as well as allow for the identification of high-yield targets for prevention.

Overall, the current report found that fewer than half (45%) of countries had national or subnational trauma registries in place. Over half of the world's countries either have registries only in a few scattered facilities or no registry at all. To address this gap, WHO has recently established a Global Registry for Emergency and Trauma Care, and implementation has been initiated in a number of middle-income countries. In addition, it is essential for countries to establish policies that ensure effective crash investigation and equitable access to information for survivors and their families.

Box 12: A simple low-cost emergency care package in Uganda

Emergency care in health facilities across Uganda is improving following a Ministry of Health scale-up of a WHO pilot intervention that halved the number of hospital deaths from emergency conditions (road traffic injuries, childhood diarrhoea, pneumonia, asthma and postpartum haemorrhage). Executed at a cost of US\$ 3500 per hospital, this pilot included WHO basic emergency care training for hospital staff, the introduction of simple WHO emergency unit protocols (including checklists and triage) and identifying and organizing a simple resuscitation area with existing resources. In addition, Uganda has undertaken pilot implementation of the WHO Global Registry for Emergency and Trauma Care at regional hospitals around the country. The registry's automated reporting functions allow data to be used to improve the quality of clinical care as well as to inform policy and planning.

CONCLUSION

TAKING STOCK AND LOOKING AHEAD

Key messages

- The Decade of Action for Road Safety 2011-2020 has led to a remarkable increase in global attention, investments and efforts to reduce deaths and injuries on the world's roads.
- While progress has been made by countries in strengthening road traffic laws, improving the safety of roads and vehicles, and enhancing post-crash care, the number of road traffic deaths and injuries remains unacceptably high.
- The progress that has been achieved has not occurred at a pace fast enough to achieve the SDG target 3.6 to reduce road traffic deaths by 50% by 2020.
- Above all, accelerating progress will require increased political will and commitment at the highest level of government.

1.35
million deaths each year

123
countries have road traffic laws that meet best practice for at least one of the key behavioural risk factors

88%
of pedestrian travel is on 1- or 2-star roads

40
countries have implemented 7 or 8 of the priority UN vehicle safety standards

109
countries have a telephone number with national coverage to activate the emergency care system

Summary of progress to date

The number of road traffic deaths continues to climb, reaching 1.35 million in 2016, while the rate of death relative to the size of the world's population has stabilized in recent years. The progress that has been achieved has not occurred at a pace fast enough to compensate for the rising population and rapid motorization of transport taking place in many parts of the world. At this rate, the SDG target 3.6 to halve road traffic deaths by 2020 will not be met. This review of key risk factors does show, however, that progress is being made in improving key road safety laws, infrastructure, adoption of vehicles standards and improving access to the post-crash care.

As countries work over time to create sustainably safe environments for road use through improved planning, design, operation and investment in the safety quality of roads, vehicles and post-crash care, the combined publicity and enforcement of key safety legislation

presents opportunities to achieve immediate and substantial road safety results. The review has found that the progress has been made across countries to bring laws into line with best practice with ten additional countries (45 in total) aligning with best practices on addressing drink-driving, five additional countries (49 in total) aligning with best practices on motorcycle helmet use, four additional countries (33 in total) aligning with best practices on the use of child restraint systems, and three additional countries (105 in total) aligning with best practices on the use of seat-belts. The number of countries with laws in line with best practices for speed management has not changed (46 in total). As a result of these interventions, an additional one billion people are now covered by road traffic laws that meet best practice.

Progress is evident in the planning, design and operation of roads and roadsides, addressing high-risk sections and areas and in the take-up of a range of tools. Vehicle safety measures continue to make a substantial and efficient contribution to reducing death and serious injuries amongst car occupants. Despite the fact that only 40 countries have implemented seven or eight of the priority UN vehicle safety standards, there are signs of progress with countries such as India producing its first four-star vehicle. There are also signs that access to post-crash care is improving.

There has also been significant progress in advancing the global road safety agenda. The Decade of Action has led to a remarkable increase in global attention, investments, and efforts to reduce deaths and injuries on the world's roads. The increased recognition and political support for road safety have fostered an enabling environment for targeted actions and are exemplified by several important developments. Examples of these include:

→ SDG targets 3.6 and 11.2 addressing road safety;

financiers

- 12 voluntary global road safety performance targets in support of the SDGs and new linkages between road safety and other public health and societal goals;
- United Nations Road Safety Trust Fund to catalyse investments in road safety in countries;
- regional data observatories to facilitate better reporting of road traffic deaths; and
- networks of legislators in Africa and the Eastern Mediterranean to facilitate the implementation of road safety legislation that meet best practice.

These outcomes are not directly captured by this report, but they contribute in critical ways to strengthening the field. Along with the investments of governments, financiers and private foundations, they have laid the foundation for future efforts and are indicative of the momentum generated in recent years.

Remaining challenges

The results presented in this report, and the developments highlighted above indicate significant moves forward have been made on road safety over the past decade. Further progress will depend upon future success in addressing the range of significant challenges which remain.

Increasing political will

Despite a better understanding of the problem and its solutions, political will to carry out the necessary actions is often lacking. Too many countries still lack funded strategies, lead agencies and good laws that are enforced.

Ensuring accountability

Improving the safety of roads requires clear responsibility and accountability that cuts across sectors. Those who plan, design, operate and use the road system share responsibility for creating a road system in which crashes do

not result in death or serious injury. This responsibility is shared across government, business, media and civil society, requiring alignment with a range of societal goals, careful governmental leadership and an effective safety performance framework. However, there needs to be clear responsibility for progress on the system as well as for each component. The establishment of lead agencies with appropriate capacity and related multisectoral coordination arrangements amongst the responsible agencies are a prerequisite for effective action.

Strengthening data collection

Robust data are a critical component for the attainment of any future target. Without the ability to assess progress and the effectiveness of efforts to reduce fatalities and injuries, countries will not be able to identify gaps in the system and deliver tailored improvements. As a result of the differences in definitions, reporting, and coding practices adopted by health, police, and insurance, the individual sources of data often provide an incomplete view of the actual situation.

Building capacity

Many countries are still struggling to establish capacity for sustainable safety management and the leadership, coordination and funding arrangements, which underpin better performance. Silo approaches to intervention persist and while there are examples of multisectoral activity and shared responsibility, these are atypical.

Looking Ahead

While many key elements of the road safety response are now well articulated, there is a failure of implementation and scale of response in most countries. Current action is insufficient to meet the targets and a large burden of unnecessary death and injury, particularly to the young, will remain without a change in political will, clear responsibilities and accountability, good data and capacity to act.

Experience shows that sustained gains in road safety only happen when a more integrated approach is taken. Going forward, it will be important to learn from experiences to date and address the factors noted above that hinder success. There is an urgent need for governments to scale up their road safety efforts in order to live up to their commitments made in the Sustainable Development Agenda 2030. The upcoming Third Global Ministerial Conference on Road Safety in Sweden in February 2020 will be a key opportunity to take a strategic view and set a road safety agenda for the next decade, including by setting a new global target on fatalities.

SECTION 2

COUNTRY/AREA PROFILES

Afghanistan

Population: 34 656 032 | Income group: Low | Gross national income per capita: US\$ 580

INSTITUTIONAL FRAMEWORK	
Lead agency	No
Funded in national budget	—
National road safety strategy	No
Funding to implement strategy	—
Fatality reduction target	—
SAFER ROADS AND MOBILITY	
Audits or star rating required for new road infrastructure	Partial
Design standards for the safety of pedestrians / cyclists	Partial
Inspections / star rating of existing roads	—
Investments to upgrade high risk locations	Yes
Policies & investment in urban public transport	Yes
SAFER VEHICLES	
Total registered vehicles for 2013	655 357
Cars and 4-wheeled light vehicles	407 608
Motorized 2- and 3-wheelers	68 090
Heavy trucks	81 416
Buses	20 589
Other	77 654
Vehicle standards applied (UNECE WP.29)	
Frontal impact standard	No
Electronic stability control	No
Pedestrian protection	No
Motorcycle anti-lock braking system	No
POST-CRASH CARE	
National emergency care access number	National, single number
Trauma registry	None
Formal certification for prehospital providers	No
National assessment of emergency care systems	No
DATA	
Reported road traffic fatalities (2016)	1 565 ^a (63% M, 10% F)
WHO estimated road traffic fatalities (2016)	5 230 (95% CI 4 502 - 5 958)
WHO estimated rate per 100 000 population (2016)	15.1

^a Traffic Police Department. Unlimited time period following crash

SAFER ROAD USERS	
National speed limit law	Yes
Max urban speed limit	90 km/h ^b
Max rural speed limit	90 km/h ^b
Max motorway speed limit	90 km/h ^b
Local authorities can modify limits	No
Enforcement	0 1 2 3 ④ 5 6 7 8 9 10
Predominant type of enforcement	—
National drink-driving law	Yes ^c
BAC limit – general population	—
BAC limit – young or novice drivers	—
Random breath testing carried out	Yes
Testing carried out in case of fatal crash	All drivers tested
Enforcement	0 1 2 3 4 5 ⑥ 7 8 9 10
% road traffic deaths involving alcohol	—
National motorcycle helmet law	No
Applies to drivers and passengers	—
Helmet fastening required	—
Helmet standard referred to and/or specified	—
Children passengers on motorcycles	Not restricted
Enforcement	—
Helmet wearing rate	—
National seat-belt law	No
Applies to front and rear seat occupants	—
Enforcement	—
Seat-belt wearing rate	—
National child restraint law	No
Children seated in front seat	Not restricted
Child restraint required	—
Child restraint standard referred to and/or specified	—
Enforcement	—
% children using child restraints	—
National law on mobile phone use while driving	No
Ban on hand-held mobile phone use	—
Ban on hands-free mobile phone use	—
National drug-driving law	Yes

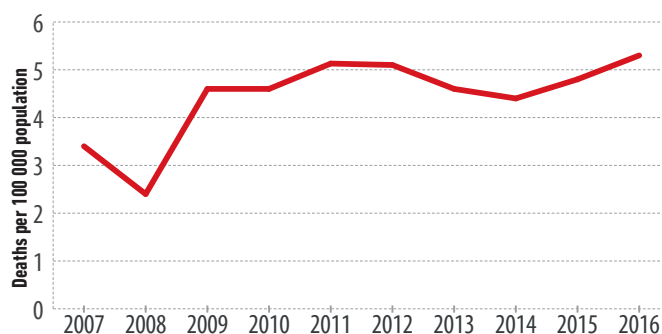

^b Speed limit set per vehicle type with a maximum speed limit of 90 km/h for fast moving vehicles, decreased by 20 km/h in mountain paths

^c Not based on BAC. Alcohol consumption legally prohibited

Deaths by road user category

Trends in reported road traffic deaths

Albania

Population: 2 926 348 | Income group: Middle | Gross national income per capita: US\$ 4 250

INSTITUTIONAL FRAMEWORK

Lead agency	Inter-ministerial Committee for Road Safety, Ministry of Transport and Infrastructure
Funded in national budget	Yes
National road safety strategy	Yes
Funding to implement strategy	Partially funded
Fatality reduction target	50% (2009-2020)

SAFER ROADS AND MOBILITY

Audits or star rating required for new road infrastructure	Yes
Design standards for the safety of pedestrians / cyclists	Partial
Inspections / star rating of existing roads	No
Investments to upgrade high risk locations	Yes
Policies & investment in urban public transport	Yes

SAFER VEHICLES

Total registered vehicles for 2016	563 106
Cars and 4-wheeled light vehicles	436 013
Motorized 2- and 3-wheelers	36 096
Heavy trucks	17 670
Buses	7 050
Other	66 277

Vehicle standards applied (UNECE WP.29)

Frontal impact standard	No
Electronic stability control	No
Pedestrian protection	No
Motorcycle anti-lock braking system	No

POST-CRASH CARE

National emergency care access number	National, single number
Trauma registry	Subnational
Formal certification for prehospital providers	Yes
National assessment of emergency care systems	No

DATA

Reported road traffic fatalities (2016)	269 ^a (81% M, 19% F)
WHO estimated road traffic fatalities (2016)	399 (95% CI 369 - 428)
WHO estimated rate per 100 000 population (2016)	13.6

^a Directorate of Road Traffic Police. Died within 30 days of crash

SAFER ROAD USERS

National speed limit law	Yes
Max urban speed limit	40 km/h
Max rural speed limit	80 km/h
Max motorway speed limit	110 km/h
Local authorities can modify limits	Yes
Enforcement	0 1 2 3 4 5 6 7 8 9 10
Predominant type of enforcement	Manual and automated
National drink-driving law	Yes
BAC limit – general population	≤ 0.05 g/dl
BAC limit – young or novice drivers	≤ 0.05 g/dl
Random breath testing carried out	Yes
Testing carried out in case of fatal crash	Some drivers tested
Enforcement	0 1 2 3 4 5 6 7 8 9 10
% road traffic deaths involving alcohol	5% ^b
National motorcycle helmet law	Yes
Applies to drivers and passengers	Yes
Helmet fastening required	No
Helmet standard referred to and/or specified	Yes
Children passengers on motorcycles	Not restricted
Enforcement	0 1 2 3 4 5 6 7 8 9 10
Helmet wearing rate	75% Drivers ^c , 60% Passengers ^c
National seat-belt law	Yes
Applies to front and rear seat occupants	Yes
Enforcement	0 1 2 3 4 5 6 7 8 9 10
Seat-belt wearing rate	85% Front seats ^c , 80% Rear seats ^c
National child restraint law	Yes
Children seated in front seat	Allowed in a child restraint ^d
Child restraint required	Up to 4 yrs
Child restraint standard referred to and/or specified	Yes
Enforcement	0 1 2 3 4 5 6 7 8 9 10
% children using child restraints	—
National law on mobile phone use while driving	Yes
Ban on hand-held mobile phone use	Yes
Ban on hands-free mobile phone use	No
National drug-driving law	Yes

^b 2016, Directorate of Road Traffic Police, Accidents Information System (AIS)

^c 2016, Directorate of Road Traffic Police

^d Children under 12 years can travel in the front if placed in an appropriate restraining device (with airbag deactivated for rear-facing restraint)

SAFER ROAD USERS^{*}

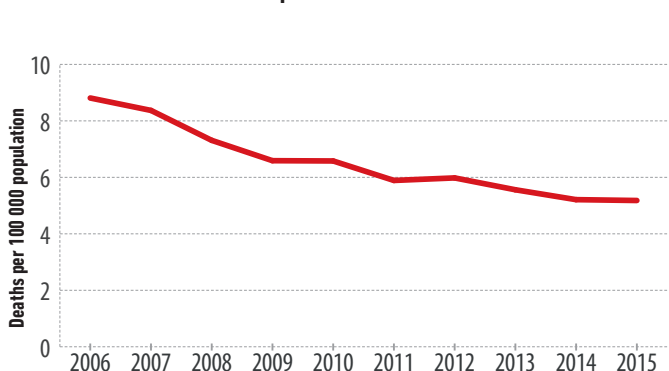

National speed limit law	Yes
Max urban speed limit	50 km/h
Max rural speed limit	50 - 100 km/h
Max motorway speed limit	80 - 100 km/h
Local authorities can modify limits	Yes
Enforcement	0 1 2 3 ④ 5 6 7 8 9 10
Predominant type of enforcement	Manual
National drink-driving law	Yes
BAC limit – general population	0.04-0.08 g/dl ^d
BAC limit – young or novice drivers	0.00-0.08 g/dl
Random breath testing carried out	Yes ^e
Testing carried out in case of fatal crash	All drivers tested
Enforcement	0 1 2 3 4 5 6 7 ⑧ 9 10
% road traffic deaths involving alcohol	30% ^f
National motorcycle helmet law	Yes
Applies to drivers and passengers	Yes
Helmet fastening required	Yes
Helmet standard referred to and/or specified	Yes
Children passengers on motorcycles	Not restricted
Enforcement	0 1 2 3 4 5 6 7 8 9 ⑩
Helmet wearing rate	98% Drivers ^g , 98% Passengers ^g
National seat-belt law	Yes
Applies to front and rear seat occupants	Yes
Enforcement	0 1 2 3 4 5 ⑥ 7 8 9 10
Seat-belt wearing rate	95% Front seats ^h , 89% Rear seats ^h
National child restraint law	Yes
Children seated in front seat	Allowed in a child restraint
Child restraint required	— ⁱ
Child restraint standard referred to and/or specified	Yes
Enforcement	0 1 2 3 4 5 6 7 ⑧ 9 10
% children using child restraints	91% ⁱ
National law on mobile phone use while driving	Yes
Ban on hand-held mobile phone use	Yes
Ban on hands-free mobile phone use	No
National drug-driving law	Yes

^{*} These data take into consideration subnational laws. A criteria is answered "Yes" if at least 80% of the subnational entities meet the criteria
^d National BAC limit is set at 0.08 g/dl. However, in practice all subnational entities have provided their own BAC limits that are reflected in the range above.
^e Legislation requires probable cause to test drivers
^f 2017, The Alcohol and Drug-Crash Problems in Canada: 2014 Report; The Traffic Injury Research Foundation of Canada
^g 2016, Police observation
^h 2010, Result of Transport Canada's Rural and Urban Survey of Seat Belt Use in Canada 2009-2010
ⁱ Child restraint laws are enacted at subnational level. While all provinces require the use of child restraints, they provide different age / height criteria to specify the period for mandatory use of child restraints / booster seats

**EXPLANATORY NOTES
AND STATISTICAL ANNEX**

A photograph of a row of old, rusted cars in a junkyard, with a teal overlay. The cars are arranged in a line, showing significant wear and tear. The background is slightly blurred, showing more cars and some greenery.

EXPLANATORY NOTE 1

METHODOLOGY, DATA COLLECTION, VALIDATION AND ANALYSIS

The methodology involved collecting data from a number of different sectors and stakeholders in each country according to the following process.

National Data Coordinators (NDCs), who were nominated by their governments, were trained in the project methodology. As representatives of their governments, they were required to identify up to eight other road safety experts within their countries from different sectors (e.g. health, police, transport, nongovernmental organizations and/or academia), to facilitate a consensus meeting with the respondents as well as to support the overall management of data collection process. While each expert responded to the questionnaire based on their expertise, the consensus meeting allowed for discussion of all responses, and the group used this discussion to agree on one final set of information that best represented their country's situation at the time (up to 2017, using the most recent data available). This was then submitted to the World Health Organization (WHO) (see Figure E1).

Figure E1: Methodology

National Data Coordinators were asked to submit laws relating to the key behavioural risk factors¹. All legislative documents were analysed by lawyers at WHO headquarters who extracted the relevant information needed to assess legislation against predetermined criteria. The legal analysis was then shared with National Data Coordinators and a validation process was undertaken to resolve any data conflicts through discussion and/or submission of new legal documents. A new addition to this report is the comparison of legislation status between December 2014 and December 2017 which gives an indication of the pace and nature of legislative changes for the behavioural risk factors reviewed. To ensure the accuracy of the comparison made, the situation at December 2014 was re-evaluated against relevant additional information and documents received in the GSRRS4 data collection process using harmonized interpretation methods. Changes in the legal data published in last report are detailed in the revision guide available at http://www.who.int/violence_injury_prevention/road_safety_status/2018/en.

The methodology used to collect information on vehicle standards was also consistent with the previous report and based on information from the UN World Forum for Harmonization of Vehicle Regulations² and interpreted with technical support from Global New Car Assessment Programme (Global NCAP).³

The report includes data from 175 countries/areas out of a total of 195, covering 7.3 billion people (98.1% of the world's population). This includes 49 high-income countries, 98 middle-income countries, and 28 low-income countries (see Table E1). Data on legislation and policies represent the country's situation as of 31 December 2017 while data on fatalities and vehicle registration are for 2016, or the most recent year for which these data were available.

Table E1: Participation in the *Global status report on road safety 2018*

Region	Number of participating countries	Number of countries in region	% population participating
African Region	44	47	93.7
Region of the Americas	30	35	98.2
Eastern Mediterranean Region	19	22	95.5
European Region	51	53	99.9
South-East Asian Region	10	11	98.7
Western Pacific Region	21	27	99.9
WORLD	175	195	98.1

¹ These behavioural risk factors are speed, drink-driving, drug-driving, the use of mobile phones while driving, failure to use motorcycle helmets, seat-belts and child restraints

² The UN World Forum for Harmonization of Vehicle Regulations (World Forum the global body responsible for the development of passenger car safety standards), <http://www.unece.org/trans/main/wp29/introduction.html>

³ Global NCAP is a British organization that conducts testing programmes that will assess the safety of motor vehicles, <http://www.globalncap.org/>

Questionnaire data

The questionnaire used for this report was based on the questionnaire used in the previous report. However, some questions were modified to improve the quality of responses and some were added or deleted. The questionnaire can be downloaded with an accompanying instruction booklet on http://www.who.int/violence_injury_prevention/road_safety_status/2018/methodology/en/.

The questionnaire, protocol and accompanying guidelines and training materials were all available in the six WHO languages (Arabic, Chinese, English, French, Russian and Spanish). Where needed, NDCs coordinated the translation of these documents into local languages and then translated back into English for the data entry stage. All data were entered into an on-line database from where data could be extracted for analysis.

Data collection began in May 2016 and was completed by December 2017. Data validation involved verifying the data against source documents where available and checking for logical inconsistencies. Discrepancies were referred back to the National Data Coordinators where possible for resolution. Following the validation process, the questionnaire data was submitted by the National Data Coordinator to an online database. Final questionnaires were generated from the online data and were sent to respective governments for review and sign-off.

Fatality data

Estimates on number of road traffic deaths relied in part on data from questionnaires as well as from other sources (see Explanatory Note 3). However, countries/areas were also asked to provide a breakdown of deaths by road user type. These proportions (where available) are reflected in the country profiles (see Explanatory Note 2) and were derived from:

- Country reported data in the current questionnaire;
- If not available from questionnaires, data that countries reported for the previous reports were used.

These values were then aggregated into regional and global estimates of deaths by road user type.

Legislative data and maps

This report collected information on a number of variables relating to legislation on the five key behavioural risk factors (speed, drink-driving, failure to use helmets, seat-belts and child restraints) as well as on two emerging risk factors, drug-driving and the use of mobile phones while driving.

Criteria analysed for each risk factor are detailed in Table E2 while the interpretation methods for each risk factor are detailed in Explanatory Note 2 on the country profiles.

The information collected was presented in various ways including:

- Country profiles, representing a summary of information for each country;
- Statistical annex, representing the full data set for each country;
- Legislative maps, showing an overview of the situation worldwide for each risk factor.

In order to code the countries for the legislative maps, three categories were used:

- Countries⁴ whose national laws meet all the criteria for best practice: shown in green – criteria considered as representing best practices in light of available evidence⁵ are highlighted, for each risk factor, in green in Table E2;
- Countries⁴ whose national laws are encouraging but where additional efforts are needed for best practice to be met: shown in yellow;
- Countries⁴ whose national laws require strong steps to be taken in order to improve their legislation: shown in red.

4 Or, in countries where laws are set at subnational level, where 80% of subnational entities meet selected criteria, except for The Federated States of Micronesia where the threshold was set at 75% as there are 4 subnational entities

5 Peden M et al., editors. World report on road traffic injury prevention. Geneva, World Health Organization, 2004

Vehicle standard data

Data on vehicle standards were collected using information from the UN World Forum for Harmonization of Vehicle Regulations⁶, the primary global body responsible for the development of passenger car safety. Technical support on analysing and interpreting this data was provided by Global NCAP⁷. Note that while these data are based on international regulations, in some countries where national regulations are considered to be equivalent to the UN standards (US, Canada, Republic of Korea, China, India, Brazil) these data are used instead. The data collected were based on the following eight variables:

- Frontal impact: UN regulation 94. Note that US regulation 208 is considered equivalent.
- Side impact: UN regulation 95. Note that US regulation 214 is considered equivalent.
- Electronic Stability Control: UN regulation 13H. Note that US regulation FMVSS 126 is considered equivalent.
- Pedestrian protection: UN Regulation 127
- Seat-belts: UN regulation 16. Note that US regulation FMVSS 210 is considered equivalent.
- Seat-belt anchorages: UN regulation 14. Note that US regulation FMVSS 210 is considered equivalent.
- Child restraints: UN regulations 44 and 129. Note that US regulation FMVSS213 is considered equivalent.
- Motorcycle anti-lock braking system UN Regulation 78.

More information on each of these regulations is included in Section 3. Data on the three variables considered to be particularly important among these seven (frontal impact, electronic stability control and pedestrian protection) are included in the country profiles. The remaining variables are shown in the Table A12 of the statistical annex.

6 Hosted by the United Nations Economic Commission for Europe (UNECE), the UN World Forum for Harmonization of Vehicle Regulations (World Forum the global body responsible for the development of passenger car safety standards). <http://www.unece.org/trans/main/wp29/introduction.html>

7 Global New Car Assessment Programme (Global NCAP) is a British organization that conducts testing programmes that will assess the safety of motor vehicles. <http://www.globalncap.org/>

Table E2: Legislative criteria assessed relating to seven behavioural risk factors

Risk factors	Legislative criteria assessed						
Speed	National speed law in place	Speed limits on urban roads ≤ 50 km/h	Local authorities have the power to modify national speed limits	Speed limit on rural roads	Speed limits on motorways		
Drink-driving	National drink-driving law in place	Drink-driving law is based on BAC or equivalent BrAC	BAC limit for general population ≤ 0.05 g/dl	BAC limit for young/novice drivers ≤ 0.02 g/dl	BAC limit for commercial/professional drivers		
Motorcycle helmets	National motorcycle helmet law in place	Law applies to motorcycle drivers and adult passengers	Law applies to all road types	Law applies to all engine types	Law requires helmet to be properly fastened	Law refers to and/or specifies a helmet standard	Law restricts child passengers on motorcycles
Seat-belts	National seat-belt law in place	Law applies to drivers and front seat passengers	Law applies to rear seat passengers				
Child restraints	National child restraint law in place	Law requires child restraint use at least until 10 yrs /135cm	Law refers to and/or specifies a child restraint standard	Law restricts children under a certain age or height from sitting in front seat			
Drug-driving	National Drug-driving law in place						
Mobile phones	National law on mobile phone while driving is in place	Law applies to hand-held phones	Law applies to hands-free phones				

■ Risk factors

■ Criteria representing best practices

■ Additional criteria presented in the country profile and/or the statistical annex

An aerial photograph of a city, featuring a prominent circular park or plaza in the center. The park has a radial design with green spaces and walkways. A major road runs vertically through the center, intersecting the park. The surrounding urban area is densely packed with buildings and houses, showing a mix of architectural styles and colors. The overall scene is captured from a high angle, providing a comprehensive view of the city's layout.

EXPLANATORY NOTE 2

COUNTRY/AREA PROFILES

The country profiles shown on pages 92-267 present a selection of core information about road safety, as reported by each of the 175 participating countries/areas. The country profiles are presented in alphabetical order. Additional national data can also be found in the Tables of the Statistical Annexes (Tables A2–A12).

Data reported for population were extracted from the United Nations Population Division database⁸ (1), while gross national income (GNI) per capita for the year 2016 came from World Bank estimates⁹ (2). Where no data were available for 2016, published data for the latest year were used. The World Bank Atlas method was used to categorize GNI into bands thus:

- Low-income = US \$ 1 005 or less
- Middle-income = US \$ 1 006 to US \$ 12 235
- High income = US \$ 12 236 or more

Flags were obtained from the World Flag Database¹⁰. Flags and country names were the latest available at the time of finalizing the report (September 2018).

The sections below reflect the way information is structured in each of the Country Profiles. They include details on how data on certain variables are presented and should be interpreted. Variables were coded as “—” if the information was unavailable or non-applicable, or if respondents had ticked a “Don’t know” response. Dates provided for data sources refer to the year in which these data were published, rather than the year that the data relate to, unless indicated otherwise.

Data collected by questionnaire were submitted through a consensus meeting (unless otherwise indicated). Each country profile indicates the Ministry that approved this questionnaire data (unless otherwise indicated). Data on legislation were based on WHO’s assessment and extensive validation of this information with National Data Coordinators, although it was not officially cleared by the government Ministry.

Institutional framework

A lead agency is considered to be the institution (either stand alone, or within a Ministry) that coordinates road safety at a national level. Information on the existence of a national road safety strategy is indicated as “Yes” or “No”. Where countries have multiple national strategies on road safety this is always represented as “Yes”.

Where countries indicated they have a fatality reduction target, information on this target is included as well as the relevant time period. Specific fatality targets are indicated either as absolute numbers of deaths, or as a rate per 100 000 population or per vehicle registered, depending on availability.

Safer roads and mobility

- Information on audits or star rating of new road infrastructure projects is reported as “Yes”, “No”, or Partial.
- Information on inspections/star ratings of existing road infrastructure projects is reported as “Yes” or “No”. Yes responses where those where respondents answered Yes for existence of formal road safety inspections and/or existence of star rating assessments. Those countries for which respondents answered Yes only for existence of maintenance safety inspections are reported as No.
- Design standards for the safety of pedestrians and cyclists is reported as “Yes”, “No”, or “Partial”. “Yes” responses included the provision of the following: Managing speed to safe system outcomes (e.g. 20 mph or 30 km/h); Safe crossings for pedestrians and cyclists; and Separation of pedestrians and cyclists from vehicular traffic. If 1-2 of the provisions were met, responses are reflected as “Partial”.

Safer vehicles

Total registered vehicles for 2016: Information about the total number of vehicles in the country includes only registered vehicles, and various categories of such vehicles. This is a cumulative number of vehicles in circulation in 2016 (or the most recent year for which data were available) not the number of vehicles brought into circulation in a particular year. In some cases where new data were not available, the figure from the 2015 Global status report has been used and footnoted to indicate this source. In a few countries the number of vehicles in subcategories did not add up to the total number provided. In some countries, respondents noted that a substantial proportion of the vehicle fleet may not be registered.

Vehicle standards applied: Information on vehicle standards presented in this report is derived from UNECE¹¹ and comprise the following:

- Frontal impact standard (UN Regulation 94 or equivalent national standard), an important minimum standard for crashworthiness;
- Electronic stability control and anti-skid system (Regulation 13H or GTR 8), relevant to crash avoidance;
- Pedestrian protection (Regulation 127 or GTR 9), important for protection of non-car occupants involved in a crash; and
- Motorcycle anti-lock braking system (Regulation 78) which help the rider maintain control of the motorcycle vehicle during an emergency braking situation

Post-crash care

- National emergency care access number is reported as “National, single number”, “National multiple number”, and “Partial coverage”. Countries with “National, single number” comprised those that had one single emergency care services access number with total country coverage, and also those having some additional numbers with partial coverage. Countries with “National multiple numbers” comprised those that had multiple emergency care services access numbers that, taken together, provide total country coverage. Countries with “Partial coverage” comprised those that had one or more emergency care services access numbers with partial country coverage overall with areas of the country remaining uncovered.
- Trauma registry variable indicates whether there was a registry in place and not whether it was regional / national or sentinel in nature.
- Formal certification pathway for prehospital providers refers to a Government or Government endorsed pathway for medics, technicians, nurses or others to be specifically certified as pre-hospital providers.
- Assessment of emergency care systems conducted at the national level comprised the comprehensive assessment of the prehospital and facility-based emergency care systems.

¹¹ <http://www.unece.org/trans/main/wp29/introduction.html>

Data

- Reported numbers of road traffic deaths are included in the Country Profiles, with a footnote to indicate the source of data and the definition of a road traffic death that was used.
- The estimated number of road traffic deaths is included based on the methodology described in Explanatory Note 3. Where this number was based on a negative binomial regression model, a 95% Confidence Interval is also shown.
- The estimated rate per 100 000 population is based on the estimated number of road traffic deaths referred to above.
- Data on the breakdown by sex may be from a different source to the official road traffic data and are converted to proportions. The proportion of deaths where the sex was unknown has not been reported in the profiles. As a result, proportions may not add up to 100% due to remaining proportions being due to cases of unknown sex. Proportions may also not add up to 100% due to rounding off or when partial information was available (indicated in a footnote).
- Reported fatality data from different countries are not necessarily comparable, as different definitions and timeframes have been used (these are noted in the footnotes or in brackets behind the data). However, the WHO estimates (both absolute numbers and rate per 100 000) allow for comparisons between countries. For more information on the fatality data see Explanatory Note 3.
- The standard colour coding of the pie charts used to represent road user deaths in the categories requested in the questionnaire is shown below. Additional categories are represented by non-standard colours as indicated in the specific Country Profiles.
- Graphs on reported road traffic fatality trends are shown either as road traffic death rates per 100 000 population (solid line) or as an absolute number of road traffic deaths (dotted line), depending on which data were supplied by the country. While many countries track decades' worth of trend data, only a 10-year period is depicted here.
- For countries providing less than 5 years' road traffic fatality trend data, this information is presented in a tabular format instead of a graph.

→ For countries with small populations where the numbers of deaths are under 50, absolute numbers of deaths rather than rates are shown. Note that in cases where data were only available for regions within a country, this information is indicated in a footnote.

- Drivers 4-wheeled cars and light vehicles
- Occupants 4-wheeled cars and light vehicles
- Passengers 4-wheeled cars and light vehicles
- Riders motorized 2- or 3-wheelers
- Drivers motorized 2- or 3-wheelers
- Pillion riders
- Cyclists
- Pedestrians
- Drivers/passengers heavy trucks
- Drivers/passengers buses
- Other/uspecified
- Drivers (all vehicles)
- Passengers (all vehicles)
- Drivers and passengers (all vehicles)

Safer road users

Data provided in this section is extracted from the questionnaire and the legislative analysis undertaken by WHO Headquarters in collaboration with NDCs.

Enforcement: respondents were asked, as individuals, to rate the effectiveness of enforcement of various elements of national road safety legislation based on their professional opinion or perception. These responses – on a scale of 0 to 10, where 0 is “not effective” and 10 is “highly effective” – are reflected here. A median of these scores is presented. Median enforcement figures are rounded off. It should be noted that these scores are subjective and should be seen only as an indication of how enforcement is perceived in the country. Many respondents expressed difficulty in assessing law enforcement at a national level since it often varies from region to region within a country and the intensity of the enforcement may vary at different times. Some countries did not wish to provide enforcement scores.

Speed: Speed limits reported here (and in the statistical tables) are the default speed limits on urban roads, rural roads and motorways for private passenger cars. The speed limits have been, where needed, converted to kilometres per hour.

‘Default speed limit’ was interpreted as the maximum speed limit applying in normal circumstances (regardless of weather, roadworks, special events, etc.) on the road type considered.

As road classifications vary greatly from country to country, National Data Coordinators were asked to confirm or correct speed limits reported in the legal analysis for the different types of roads according to the definitions used in the country concerned. In countries, where National Data Coordinators have indicated that motorways do not exist in their country, this is noted with a footnote.

In some countries, the legislation does not articulate speed limits by road type but only by vehicle type. In these countries, the speed limit provided for private passenger cars is reported in the country profile and statistical annex for all road types, with a footnote indicating that this is a speed limit set per vehicle type and not based on the road type.

The criterion «local authorities able to modify speed limit» is answered Yes if the speed limit can be altered at local level in any way (decreased and/or increased). The definition of local authorities is interpreted broadly as any entity that is not from the central system of government (i.e. not from a national ministry) having a jurisdiction over a local area whether the local area is a region, a province, a district, a department or a city. This criterion is automatically answered Yes for countries in which laws are set at subnational level if at least 80% of subnational entities of the country have set their own speed laws.¹²

Drink-driving: Blood alcohol concentration (BAC) limits (or breath alcohol limits converted to BAC limits) refer to the maximum amount of alcohol legally acceptable in the blood of a driver on the road – i.e. the blood alcohol level above which a driver may be punished by law. This figure is provided for the general population, and for young/novice drivers in grams per decilitre (g/dl). This survey gathered information on drink-driving laws regardless of the legal status of alcohol in the country. Where alcohol consumption was legally prohibited in a country, as reported in the final country questionnaire, this is indicated by a footnote. BAC limits are reported with a dash (“–”) for countries that have a drink-driving law that is not based on blood (or equivalent breath) alcohol concentration, and with a corresponding footnote.

- The use of random breath testing is indicated based on countries’ reports of whether or not such testing is carried out in practice. Those countries where legislation specifically prohibits primary enforcement of drink-driving laws, and thus random breath testing, are indicated as such in a footnote.
- Deaths attributable to drink-driving were included only when the estimate was based on a published source. In many cases these are not national estimates (as indicated in the source). These estimates are rounded up.

¹² Or in the case of Micronesia (Federated States of), if at least 75% of the subnational entities have enacted speed laws

Motorcycle helmets: A country is interpreted as having a helmet law covering all riders where the law requires helmet use for both the driver and the (adult) passenger, on all road types and for all types of motorcycles (regardless of engine type). A reference to « riders » in the law is understood to include both drivers and passengers. Countries where helmet laws apply only to certain types of roads, at certain times or in certain areas were interpreted as not providing sufficient coverage to be considered as applying to all drivers and passengers.

The criteria «Law refers to and/or specifies a helmet standard» is answered Yes if the law refers to:

- a specific standard (such as ECE 22 or a national standard), or
- an authority in charge of setting such a standard, or
- regulations or rules to specify or develop a standard.

Information on the actual adoption of the regulations prescribing a helmet standard was not always available; in case where the NDCs indicated that the standard had not yet been set, a corresponding footnote was included in the country profile.

The criteria « children passengers on motorcycles » shows whether a country restricts children as passengers on motorcycles and if yes, for what age group.

For information on motorcycle helmet rates (derived from the final country questionnaires), these data were included only when a published source was indicated. The most disaggregated data are presented here, i.e. separate figures are provided for drivers and passengers where this information was provided. Note that the information provided for drivers and passengers does not necessarily represent the same year, nor come from the same source, as indicated in the corresponding footnotes. The data on passenger rates refer to adult passengers unless otherwise indicated. In many cases these are not national estimates (as indicated in the source).

Seat-belts: A country is interpreted as having a seat-belt law covering all occupants where the law requires seat-belt use for the driver, front seat passenger and rear seat passengers at all times and on all roads. Countries where seat-belt laws apply only at certain times or on certain roads were interpreted as having a national seat belt law not applying to all occupants.

For information on seat-belt wearing rates (derived from the final country questionnaires), these data were included only when a published source was indicated. Where available, information on wearing rates disaggregated by front and rear seat occupants was used. Where respondents provided explanatory information on these data, for example, a source or information on geographical coverage, this information is summarized in the footnotes. Note that the information provided for front seat and rear seat occupants does not necessarily represent the same year, nor come from the same source, as indicated in the corresponding footnotes.

Child restraints: A country is interpreted as having a child restraint law where the country requires the mandatory use of child restraint systems for an identified group of children based on either their height and/or their age and/or their weight.

Child restraints include rear-facing child restraints, forward facing child restraints as well as booster seats. Regular (adult) seat-belts, on their own, are not counted as appropriate child restraints. Countries whose legislation required that children within a certain age group/height be restrained either by a seat-belt or in a child restraint use were reported as not having a child restraint law for this age group/height. Countries that referred to child restraint use for children seated in the front only (and not in the rear) were reported as not having a child restraint law. Countries that referred to either child restraint use or “other means” were considered as not meeting the criteria “standard”, and this detail was reflected in a footnote in the country profile.

The age and/or height reported for the criteria “child restraint required” corresponds to the period for which only child restraint systems are allowed to restrain children (i.e. no other form of restraint is allowed such as seat-belts only, “other means” etc.).

The criterion «Law refers to and/or specifies a standard» is answered Yes if the law refers to:

- a specific standard (such as ECE 44 or ECE 129), or
- an authority in charge of setting such a standard, or
- regulations or rules to specify or develop a standard.

Information on the actual adoption of the regulations prescribing a standard was not always available; in case where the NDCs indicated that the standard had not yet been set, a corresponding footnote was included in the country profile.

The criterion « children seated in front » shows whether a country restricts children as passengers in the front seat and if so, what is the restriction set (complete ban, or subject to placing the child in a restraint) and for which age group.

Information on rates of child restraint use (derived from the final country questionnaires) are presented when a source was provided for the estimate and are included in the most disaggregated form available. Most countries that provided this data, however, had data on children in restraints that was not broken down by age group. Note that where multiple studies are available this information does not necessarily represent the same year, nor come from the same source, as indicated in the corresponding footnotes.

EXPLANATORY NOTE 3

**ESTIMATION OF TOTAL
ROAD TRAFFIC DEATHS**

During the process of preparing the fourth Global status report on road safety, WHO generated estimates of road traffic deaths for 2016 for all Member States. Road traffic deaths were estimated by building on the methods used in the third global report by improving and updating the database of vital registration, the data collection instrument (survey) and the database of the covariates for regressions. These estimates were used to generate regional and global estimates, while estimates for individual countries are included in the report only for the 175 countries that participated in the survey.

Death registration information is submitted to WHO regularly by Ministries of Health from around the world, and most is coded using the International Classification of Diseases 9th or 10th revisions (1, 2, 3). Using this classification all deaths that follow from a road traffic death are counted as such, regardless of the time period in which they occur (unlike many official road traffic surveillance data sources, where road traffic death data are based on a 30-day definition following a road traffic crash). WHO applies certain criteria to ascertain the quality of this death registration data and where the death registration data were considered to be of high quality these data were used for this report¹³.

For those countries without such good vital registration data, and for which other sources of information on causes of death were unavailable¹⁴, the estimates were based on covariates (some collected in the survey of Member States, others from available published sources). The regression models were fitted to data for the period 2000–2016, a time series for each covariate was used for this period for each Member States. The improved regression model estimated road traffic deaths (all ages, both sexes) as a function of a set of covariates that include measures of economic development, road transport factors and legislation, road use and safety governance/enforcement and health system access.

Due to the availability of new data, and updated time series for many covariates used in the regression, estimates for the full-time series have been revised. Hence, the WHO 2016 estimates are not directly comparable to previous WHO estimates published in the previous global status reports on road safety (4, 5). The 2018 estimation represents the best estimates of WHO for fatalities that occurred during 2016 and earlier years, based on the evidence available up to September 2018. These estimates are not necessarily the official estimates of Member States for that year and are not necessarily endorsed by Member States. However, during the preparation of the report a consultation letter was sent to each Member State that

¹³ For details on criteria used to assess quality of vital registration data see reference 3 and Explanatory Note in references 4 and 5.

¹⁴ However, in some countries other sources of information on deaths were used: where total deaths reported from the national surveillance system were greater than the deaths estimated from the regression or from the death registration data, these were used.

participated in this fourth Global status report on road safety explaining the methodology used during this estimation process and the latest data used for this purpose. In order to allow global and regional comparisons to previous years, the global and regional estimates for previous years were recalculated based on the new data and methods used for 2016.

Approaches to estimation

As in the second and third reports, there are four groups of countries and the estimation methodology for each group is described in detail below.

1. Countries with death registration data

This group includes 86 countries with death registration data meeting the following completeness criteria: completeness for the year estimated at 80% or more, or average completeness for the decade including the country-year was 80% or more. Total road traffic deaths were calculated from the death registration data and population data reported to WHO as follows. Injury deaths classified as “undetermined intent” were redistributed pro-rata across all unintentional and intentional injury categories within age-sex groups. These data were then used to compute age-sex-specific death rates for road traffic deaths. Where completeness was assessed at less than 100%, death rates were adjusted for incompleteness by multiplying by $(100/\text{completeness } \%)$. These death rates were applied to the UN estimates of population by 5-year age group and sex (World Population Prospects 2016) to estimate total road traffic deaths for each country-year.

These countries fall into three categories:

- Countries with death registration data for year 2016 where the estimated road traffic deaths for 2016 exceeded number reported from the surveillance system. The death-registration based estimate is used. This category contains 9 countries.
- Countries where the latest death registration data submitted to WHO is earlier than 2015 but not earlier than 2007. Deaths in year 2016 were estimated based on a projection of the most recent death registration data using the trends in reported surveillance data: this category contains 54 countries.
- Countries where the reported number of road traffic deaths adjusted to unlimited time for 2016 exceeded the estimate based on death registration data. For 23 countries, the reported road traffic deaths were used for year 2016.

2. Countries with other sources of information on causes of death

For India, Thailand and Viet Nam, data on total deaths by cause were available for a single year or very few earlier years. These data sources are documented in Annex B of the Global Burden of Disease: 2004 update report (WHO 2008) and as well as some more recent studies submitted to WHO. For these countries, the regression method described below was used to project forward from the most recent year for which an estimate of total road traffic deaths was available.

3. Countries with populations less than 150 000

For 9 small countries with populations less than 150 000 and which did not have eligible death registration data, regression estimates were not used. The reported deaths were used directly without adjustment.

4. Countries without eligible death registration data

For these countries without death registration data at least 80% complete and with populations greater than 150 000, a regression model was used to estimate total road traffic deaths. As for the first report, we used a negative binomial regression model, appropriate for modeling non-negative integer count data (number of road traffic deaths) (Law 2009, Hilbe 2007). A likelihood ratio test was used to assess that the negative binomial model provided a better fit to the data than a Poisson model (where the variance of the data is constrained to equal the mean).

$$^{(1)} \ln N = C + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n + \ln Pop + \varepsilon$$

where N is the total road traffic deaths (for a country-year), C is a constant term, Xi are a set of explanatory covariates, Pop is the population for the country-year, and ε is the negative binomial error term. Population was used as exposure, making it possible to interpret the coefficients (β_i) for the independent variables as effects on rates rather than a count. In a previous study, this type of model was used to represent «accident proneness» (Greenwood and Yule, 1920). Karlaftis and Tarko (1998) have also found a negative binomial regression model to be the appropriate for count data such as road traffic fatalities.

The parameters $\beta_1, \beta_2, \beta_3 \dots \beta_n$ (equation 1) were estimated by fitting the negative binomial regression model to estimated total road traffic deaths for all country-years in the range 2000-2016 meeting the completeness criteria. by using the number of road of traffic deaths from countries from group 1 described above. We chose three models (Models A, B and C) that had good in-sample- and out-of-sample fit, and for

which all the covariates were statistically significant and overall estimation is the average of the prediction of these three best models. The table below describes the covariates used for our model:

Table E3: Covariates used in the model

Independent variables	Description	Source of information	Included in models
In (GDP)	World Development Indicators (2017) and WHO estimates of Gross Domestic Product (GDP) per capita (international dollars or purchasing power parity dollars, 2011 base)	World bank and WHO database	Models A, B, C
In (vehicles per capita)	Total vehicles per 1000 persons	GSRRS surveys and WHO database	Models A, B, C
Road density	Total roads (km) per 1000 hectares	International Futures database	Models A, B, C
National speed limits on rural roads	The maximum national speed limits on rural roads (km/h) from WHO questionnaire	GSRRS survey	Models A, B, C
National speed limits on urban roads	The maximum national speed limits on urban roads (km/h) from WHO questionnaire	GSRRS survey	Models A, B, C
Health system access	Health system access variable (principal component score based on a set of coverage indicators for each country)	Institute for Health Metrics and Evaluation dataset	Models A, B, C
Alcohol apparent consumption	Liters of alcohol (recorded plus unrecorded) per adult aged 15+	WHO database	Models A, B, C
Population working	Proportion of population aged 15–64 years	World Population Prospects 2017 revision	Models A, B, C
Percentage motorbikes	Per cent of total vehicles that are motorbikes	GSRRS survey	Model B
Corruption index	Control of corruption index (units range from about -2.5 to +2.5 with higher values corresponding to better control of corruption)	World Bank (Kaufmann et al 2009), International Futures database	Model B
National policies for walking /cycling	Existence of national policies that encourage walking and / or cycling	GSRRS survey	Model C
Population	Total population (used as offset in negative binomial regression)	World Population Prospects 2017 revision (UNDESA)	Models A, B, C

Table E4: Overview of methods used to obtain comparable country estimates

Estimation method	Country
GROUP 1 Countries/areas with good death registration data	Argentina, Australia, Austria, Azerbaijan, Barbados, Belarus, Belgium, Belize, Brazil, Bulgaria, Canada, Chile, China (14, 15), Colombia, Costa Rica, Croatia, Cuba, Cyprus, Czechia, Denmark, Dominican Republic, Ecuador, Egypt, El Salvador, Estonia, Fiji, Finland, France, Georgia, Germany, Greece, Guatemala, Guyana, Hungary, Iceland, Iran (Islamic Republic of), Ireland, Israel, Italy, Jamaica, Japan, Kazakhstan, Kuwait, Kyrgyzstan, Latvia, Lithuania, Luxembourg, Maldives, Malta, Mauritius, Mexico, Montenegro, Netherlands, New Zealand, Norway, Oman, Panama, Paraguay, Philippines, Poland, Portugal, Qatar, Republic of Korea, Republic of Moldova, Romania, Russian Federation, Saint Lucia, Serbia, Singapore, Slovakia, Slovenia, South Africa, Spain, Suriname, Sweden, Switzerland, The former Yugoslav Republic of Macedonia, Trinidad and Tobago, Turkey, Ukraine, United Kingdom, United States of America, Uruguay, Uzbekistan, Venezuela (Bolivarian Republic of), West Bank and Gaza Strip
GROUP 2 Countries with other sources of cause of death information	India (16,17,18), Thailand, Viet Nam
GROUP 3 Countries with populations less than 150 000	Antigua and Barbuda, Cook Islands, Dominica, Grenada, Kiribati, Micronesia (Federated States of), San Marino, Seychelles, Tonga
GROUP 4 Countries without eligible death registration data	Afghanistan, Albania, Angola, Armenia, Bangladesh, Benin, Bhutan, Bolivia (Plurinational State of), Bosnia and Herzegovina, Botswana, Burkina Faso, Burundi, Cabo Verde, Cambodia, Cameroon, Central African Republic, Chad, Comoros, Congo, Côte d'Ivoire, Democratic Republic of the Congo, Equatorial Guinea, Eritrea, Eswatini, Ethiopia, Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Honduras, Indonesia, Iraq, Jordan, Kenya, Lao People's Democratic Republic, Lebanon, Lesotho, Liberia, Libya, Madagascar, Malawi, Malaysia, Mali, Mauritania, Mongolia, Morocco, Mozambique, Myanmar, Namibia, Nepal, Niger, Nigeria, Pakistan, Papua New Guinea, Peru, Rwanda, Samoa, Sao Tome and Principe, Saudi Arabia, Senegal, Solomon Islands, Somalia, South Sudan, Sri Lanka, Sudan, Syrian Arab Republic, Tajikistan, Timor-Leste, Togo, Tunisia, Turkmenistan, Uganda, United Arab Emirates, United Republic of Tanzania, Vanuatu, Zimbabwe

^a Population Division of the Department of Economic and Social Affairs of the United Nations Secretariat (June 2017). World population Prospects: The 2017 Revision, Highlights. New York: United Nations.

^b Gross National Income (GNI) per capita is the dollar value of a country's final income in a year divided by its population using Atlas methodology. Data from World Development Indicators database, World Bank, November 2017. <http://data.worldbank.org/indicator/NY.GNP.PCAP.CD/countries>.

^c World Development Indicators database: Low income is \$1 005 or less, middle income is \$1 006 to \$12 235, high income is \$12 236 or more.

^d Modelled using negative binomial regression (see preamble on page 289). Data from countries with good vital registration and countries with a population of less than 150 000 were not included in the model.

^e 2016 data not available.

^f From Jan-Oct 2016.

^g 2016 data not available. Latest available used from World Development Indicators database.

^h Drivers and passengers (all vehicles).

ⁱ Data for Libreville.

TABLE A3: POST-CRASH RESPONSE BY COUNTRY / AREA

Country / Area	Universal access telephone number	Trauma registry	National assessment of emergency care system
Afghanistan	National, single number	None	No
Albania	National, single number	Subnational	No
Angola	National, multiple numbers	National	Yes
Antigua and Barbuda	National, single number	–	No
Argentina	Partial coverage	Some facilities	No
Armenia	National, single number	National	No
Australia	National, single number	National	No
Austria	National, single number	National	No
Azerbaijan	National, single number	National	No
Bangladesh	Partial coverage	None	No
Barbados	National, multiple numbers	National	No
Belarus	National, single number	None	No
Belgium	National, single number	National	No
Belize	National, single number	None	No
Benin	National, single number	Some facilities	No
Bhutan	National, single number	None	No
Bolivia (Plurinational State of)	Partial coverage	Subnational	No
Bosnia and Herzegovina	National, single number	None	Yes
Botswana	National, multiple numbers	None	No
Brazil	National, single number	None	No
Bulgaria	National, single number	None	No
Burkina Faso	National, single number	Some facilities	Yes
Burundi	None	National	No
Cabo Verde	National, multiple numbers	Some facilities	No
Cambodia	National, multiple numbers	National	No
Cameroon	National, single number	Some facilities	Yes
Canada	Partial coverage	Subnational	No
Central African Republic	–	Some facilities	No
Chad	–	Some facilities	No
Chile	National, single number	National	No
China	National, single number	National	Yes
Colombia	Partial coverage	National	No
Comoros	None	None	No

- ^a Speed limit set per vehicle type with a maximum speed limit of 90 km/h for fast moving vehicles, decreased by 20 km/h in mountain paths
- ^b Applies in the City of Saint John's and in designated «speed limit areas»
- ^c The limit in residential area is reduced to 60 km/h
- ^d Speed limit set per vehicle type with a maximum speed limit of 70 miles per hour (112 km/h) for light vehicles
- ^e Speed limit set per vehicle type with a maximum speed limit of 80 km/h for specified vehicles including private motor cars
- ^f The 90 km/h speed limit applies on rural areas in Brussels capital region and Wallon region while there is a 70 km/h speed limit in the Flemish region
- ^g Can be increased to an unspecified speed under certain circumstances
- ^h Can be increased up to an unspecified speed
- ⁱ This limit applies to unpaved roadways while on undivided highway the maximum speed limit is 100 km/h for automobiles, light trucks and motorcycles
- ^j Can be increased up to an unspecified limit under certain circumstances
- ^k Traffic code refers to regulations to set maximum speed limits, regulations not available
- ^l Speed limit applicable on any road, decreased to 30 km/h in reduced speed zones
- ^m Can be increased up to 80 km/h
- ⁿ Traffic signs may on certain public highways provide for a higher speed limit not exceeding 80 km/h
- ^o Speed limits can be modified at local level by the road authorities and the police
- ^p Can be increased up to 90 km/h on certain conditions
- ^q No motorways in the country
- ^r Speed limit for public roads is 100 km/h for a road with a surface of concrete, bitumen or tar and 80 km/h for other roads
- ^s There is no maximum speed limit on motorways
- ^t Speed limits set per vehicle type and road type - for motor cars, speed limits are: 30 mph (48 km/h) on restricted roads, 60 mph (96 km/h) on Timehri / Linden Highway and 40 mph (64 km/h) elsewhere
- ^u Legislation refers to regulations to set maximum speed limits, regulations not available
- ^v Speed limit set per vehicle type with a maximum speed limit of 100 km/h for passengers cars comprising not more than eight seats in addition to the driver's seat
- ^w 110 km/h for main suburban roads, 90 km/h for secondary suburban roads
- ^x Can be increased up to 90 km/h
- ^y Can be increased or decreased to an unspecified speed under certain circumstances
- ^z Can be modified up to 80 km/h
- ^{aa} Speed limit set per vehicle and road type with a maximum speed limit for passengers cars of 110 km/h on highways and 90 km/h on other roads
- ^{ab} Speed limit set per vehicle type with a maximum speed limit of 30 km/h for specified vehicles, except in designated areas with higher speeds
- ^{ac} Speed limit may be increased by the governor (Kosrae, Yap) or by the director of the department of public safety (Pohnpei)
- ^{ad} Speed limit set per vehicle type with a maximum speed limit of 80 km/h for specified vehicles including cars, and a maximum limit of 40 km/h in an area with dense settlement

- ^{ae} 60 km/h from 23:00-05:00
- ^{af} Local authorities can modify national speed limits through the posting of speed signs
- ^{ag} Speed limit set per vehicle type with a maximum speed limit of 80 km/h for passengers cars (not exceeding 3500 kg)
- ^{ah} Can be increased to 80 km/h
- ^{ai} Speed limits depend on the geographical area considered: the maximum speed limit is 40 km/h on roads in Greater Victoria and 80 km/h on any other roads; different speed limits are set for the island of praslin and la digue subject respectively to a 65 km/h and 25 km/h speed limit
- ^{aj} Different speed limits are set in urban areas ranging from 30 km/h to 70 km/h
- ^{ak} No rural roads in Singapore
- ^{al} Can be increased up to 70 km/h
- ^{am} Speed limits are established locally per vehicle type and / or per road names or areas
- ^{an} Road authorities can decrease speed limits on both urban and rural roads. Speed limits can only be increased on urban highways
- ^{ao} Ministry of Interior can increase speed limits by 20 km/h for automobiles
- ^{ap} Speed limits are established at subnational level per streets' names
- ^{aq} A 120 km/h speed limits applies on roads having a bituminous surface coat of 6 metres of more in width

^a Not based on BAC

^b Alcohol consumption legally prohibited

^c ≤0.2 g/l for motorcycles drivers

^d Legislation requires probable cause to test drivers

^e Law not based on BAC / BrAC

^f Legislation requires probable cause to test drivers or commission of a traffic offence

^g Legislation refers to testing in case of crash

^h Any presence of alcohol in the body is prohibited

ⁱ Legislation refers to alcohol testing in case of reckless driving or in the case of a crash

^j BAC limit introduced by the traffic act 2017, at December 2017, the notice of commencement had not yet been signed

^k Legislation banning drug driving only applies to bus and truck drivers

^l For commercial drivers limits are as follows: «≤ 9 microgrammes in 100 ml (BrAC), 20 mg in 100 ml (BAC) and 27 mg in 100 ml of urine» while there is a 0 limit for driver of buses, coaches and other vehicles carrying passengers for a fee

^m Not based on BAC in 19 out of 32 states

ⁿ In Yap a BAC limit is provided in the law. In Kosrae and Pohnpei, the law is not based on a BAC limit. No data is available for Chuuk

^o Law based on breath alcohol concentration, values converted to BAC

^p The legislation, as amended in 2016, refers to an alcohol legal limit of «0.05» for the general population but does not specify the unit to consider

^q The legislation, as amended in 2016, refers to an alcohol legal limit of «0.002» for young or novice drivers but does not specify the unit to consider

^r The legislation, as amended in 2016, refers to an alcohol legal limit of «0.000» for commercial drivers» but does not specify the unit to consider

^s Law not based on BAC

^t Driving with presence of any alcohol in the body is prohibited

^u The law refers to regulations to set BAC limit, regulations not available

^v Different Bac limits are set depending on the type of vehicle used: for drivers of cars the bac limit is set at 0.00g/dl while for drivers of motorcycles and mopeds the legal bac limit is set at 0.05g/dl

Random breath testing carried out	Testing carried out in case of fatal crash	Enforcement	% road traffic deaths involving alcohol	National drug driving law	Alcohol prohibited

* National BAC limit is set at 0.08 g/dl. However, in practice all subnational entities have provided their own BAC limits that are reflected in the range above

** Drivers of public transport vehicles are subject to a BAC limit of 0.02 g/dl while other commercial drivers are subject to the BAC limit applicable to the general population (≤0.05g/dl)

*** Over this limit there is a presumption of alcohol impairment (from 0.05 to 0.15 no presumption established but the alcohol concentration can be used to decide on the guilt or innocence of the driver)

**** Except for drivers of public transport and dangerous cargo subject to a blood alcohol concentration limit of 0.00 g/dl

***** In Scotland legal BAC limit is ≤ 0.05 g/dl

***** Over 90% of the states provide a BAC limit equal or under 0.02 g/dl for young-novice drivers

- ^a Restrictions vary depending on the type of motorcycles: children under 3 years are not allowed on mopeds and motorcycles, children under 8 years are not allowed on motorcycles over 125cc
- ^b Percentage are for day - and night -time observations, respectively
- ^c Obligation to use a helmet only applies to those riding on a motorcycle travelling above 40 km/h (except for specific provisions in Rarotonga - persons between 16 and 25 and visitors required to wear helmet at all speeds)
- ^d Except if motorcycle is fitted with one additional seat designed to transport children
- ^e Children who are 7 years or younger shall be placed in an appropriate child seat while children older than 7 years shall be able to have their feet reaching the pedals
- ^f Helmet use is required for motorcycles, defined as two or three wheeled vehicles powered by a mechanical engine of 125 cc or more. The use of motorcycles with an engine of less than 125cc is forbidden on public roads
- ^g Helmet provisions introduced by the Traffic Act 2017, at december 2017, the notice of commencement had not yet been signed
- ^h Does not apply to mopeds
- ⁱ Only required on roads where vehicles may be driven at a speed higher than the normal limit

^j Reference is made to regulations to specify the types, shape and construction of helmets

^k Children under 12 can be transported on a motorcycle provided that there is a special support installed in the rear seat

^l As prescribed by the responsible state administration

^m Restrictions for children to ride as passengers on motorcycles are only set for some types of roads (where there is heavy volume of vehicles, a high density of fast moving vehicles or a speed limit of more than 60 km/h). on these roads conditions for children to be allowed to ride as passengers are follows: child's feet can reach the foot peg of the motorcycle, child's arm can reach and grasp the waist of the driver and child is wearing a standard protective helmet

ⁿ Speed limit for motorcycles transporting a child under 7 is limited to 40 km/h

^o Children under 14 allowed to be transported in the motorcycle sidecar and must be held in the arms under 7

^p Reference is made to regulations to specify helmet types, in 2017 these regulations were in the process of being developed

^q Only children older than 12 years old are allowed to ride as passengers on motorcycles

^r About 40% of the states require helmets for both drivers and passengers on motorcycles

^s Less than 10% of the states prohibit that children ride as passengers on motorcycles

- ^a The obligation to use seat belt does not apply in residential areas nor for children under 12
- ^b Legislation requires drivers and passengers «and particularly those sitting in the front» to use a seat belt
- ^c Obligation to use seat belts for all passengers only applies outside cities and densely populated areas. Inside cities and densely populated areas, only the driver and front seat passenger sare required to wear a seat belt
- ^d Rear seat passengers as children under 12 are not subject to the obligation to use a seat belt
- ^e Percentage are for expressways and other roads, respectively
- ^f Only required on roads where vehicles may be driven at a speed higher than the normal limit
- ^g Seat belts are only required outside cities
- ^h The use of seat belt for rear seat passengers is only required outside urban areas
- ⁱ For rear seat passengers, seat-belt required only outside cities
- ^j Percentages reflect «urban» and «outside urban» areas, respectively
- ^k Percentage are for «England and Scotland» and «NI», respectively
- ^l About 40% of the states do not require seat belt for rear seats passengers
- ^{*} 96% for cars; 89% for vans; 88% for taxi

- ^a Children under 12 years can travel in the front if placed in an appropriate restraining device (with airbag deactivated for rear-facing restraint)
- ^b A 2018 amendment (not covered in the review period ending at December 2017) raised the age for mandatory child restraint use to 10 years old
- ^c Transport of children under 12 years in the front seat shall be made in a «child protecting device»
- ^d In no circumstances are children under 4 years allowed to sit in the front. Children from 4 to 7 years can sit in the front only if there is no room for them in the back due to the back seats being occupied by other children under 7 years
- ^e Child restraint systems are only required for children under 12 years seated in the front
- ^f For children aged 5-12 years, either CRS or «other means» (than CRS) can be used to secure the child using the seat belt
- ^g If rear-facing child restraints, airbag shall be deactivated
- ^h All child restraints sold in Belgium must comply with UNECE regulation
- ⁱ Provided that airbag is deactivated if child is in a rear-facing child restraint system
- ^j Children aged 5-12 years can be either restrained in a booster seat or in a child restraint
- ^k By exception, a child under 2 years can be seated in the front if there is no airbag installed or if the airbag is deactivated when the child is seated in a rear-facing seat
- ^l Data only for Republic of Srpska
- ^m The legislation refers to the use of either child restraint systems or seat-belts for children
- ⁿ Children under 12 yrs / 150 cm shall normally sit in the rear except if placed in a suitable restraint
- ^o Enters into force in January 2020
- ^p Ban on children under 10 years travelling in front seats enters into force in January 2020
- ^q Child restraint laws are enacted at subnational level. While all provinces require the use of child restraints, they provide different age / height criteria to specify the period for mandatory use of child restraint / booster seats
- ^r Legislation only recommends («as far as possible») to place children under 12 years in the rear
- ^s A child under 2 years travelling with a driver only shall be placed in a child restraint. If there is an adult passenger, the child can be held by the adult instead of being placed in a child restraint.
- ^t A child of height 135-150 cm can be restrained with an adult seat belt only provided that this child sits in the rear of the car
- ^u Children under 2 years shall be either accompanied by adults or restrained with special accessories

- ^v Provided that airbag is deactivated if a rear-facing restraint is used
- ^w Children aged 6-12 years shall be placed in a booster seat
- ^x The legislation refers to seat belt or child restraints for children under 12 years but does not yet specify a minimum age / height / weight under which only child restraint systems can be used
- ^y Except for children under 2 yrs old or 15 kg who are required to be transported in a child restraint
- ^z Legislation refers to the use of child restraint or seat belts for «children over 9» while children under 3 years are required to be placed in a restraint only while seated in the front
- ^{aa} Except for an infant under 3 years fitted in a proper restraint
- ^{ab} The legislation generally states that children not tall enough to wear a seat belt must be secured by a safety device corresponding to the height and weight of the child but does not specify age / height / weight group covered
- ^{ac} Legislation requires that children under 7 years be either accompanied by an adult or «hugged by an instrument made for safety purpose»
- ^{ad} The obligation to use a child restraint for children under 8 years sitting in the rear is subject to the availability of a restraint system in the car
- ^{ae} By exception, children under 10 years can sit in the front if placed in a rear-facing child restraint (if front airbag is deactivated) or if there are no available rear seats
- ^{af} Under the road traffic act, children aged 5 years and below shall not sit in the front, while under the road traffic regulations they can sit in the front if placed in a child restraint
- ^{ag} The use of seat belt is allowed for children of height 135-150 cm sitting in the rear
- ^{ah} The legislation refers to homologated seats for children under 18 months and to cribs and hammocks for children under 10 years
- ^{ai} The legislation refers to child restraint system for children but does not specify the age / height group covered by this obligation
- ^{aj} Legislation refers to the protection of children under 5 years but does not specify which form this protection takes
- ^{ak} Children of height 135 - 150 cm can be restrained with seat belts only if they sit in the back
- ^{al} Seating of children under 150 cm allowed in the front only if front airbag deactivated
- ^{am} The law prohibits children to sit in the front but does not specify the age, size or weight of children concerned
- ^{an} For children under 3 years, a child restraint is required (an a rear facing child restraint for children under one year) while for children aged 3-8 years the legislation refers either to child restraint or booster seat use
- ^{ao} The legislation requires that children under 12 years be placed in a child restraint or «other means» used in conjunction with a seat belt
- ^{ap} The traffic act 2017 requires children aged 1-16 years to be either seated in the back with a seat belt or restrained by passenger over 16 yrs
- ^{aq} Legislation only refers to the use of child restraints for children under 12 years travelling in the front
- ^{ar} Children under 12 years travelling in the front of a car must be placed in a child restraint
- ^{as} The law states that children unable to wear normal seat belts must be placed in a child restraint seat but no specific age / weight / height is specified
- ^{at} Except if no seat belt is fitted in the vehicle, in which case children under 150 cm shall be travelling in the rear
- ^{au} Legislation refers to regulations to further specify the child restraint rules
- ^{av} If transported in rear facing restraints, airbag must be deactivated
- ^{aw} Children under 13 years can be restrained either by a child restraint systems or a seat belt
- ^{ax} Legislation refers to child restraint use for children up to 12 yrs /150 cm but allows children aged 3 year and over, in the absence of an available restraint, to travel in the rear without a restraint. For children under 3 years, a child restraint shall be mandatorily used
- ^{ay} By exception, a child under 3 years can be transported in the front of the vehicle if placed in a rear-facing restraint provided that airbag is deactivated
- ^{az} Except for infants under 3 years in a rear-facing child restraint air airbag deactivated
- ^{ba} The law requires the use of child restraints for children (defined as people between the age of 3 and 14) if available or the use of a seat belt if a child restraint is not available if an unoccupied seat fitted with a seat belt is available
- ^{bb} 93% 0-4 years, 95% 5-9 years
- ^{bc} Child restraints are required for children under 150 cm. By exception, children of height 135-150 cm can be restrained with a seat belt only if sitting in the rear
- ^{bd} Children under 2 years shall be placed in a child restraint only where there is no other passenger seated in the rear
- ^{be} Children can sit in the front as long as they are using a seat belt
- ^{bf} Legislation requires the use of the seat belt for children from 3-12 years old
- ^{bg} Ban on front seating set for children aged 6 years and below
- ^{bh} Except for children under 3 years in a rear-facing child restraint with airbag deactivated
- ^{bi} Only required for small children (defined as children under 6) sitting in the front
- ^{bj} Safety seats required for small children (defined as children under 6) sitting in the front
- ^{bk} The legislation refers to the use of child restraint systems or other means to transport children under 12 years
- ^{bl} If in accordance with the manufacturer's instruction and for rear-facing restraint if airbag is deactivated
- ^{bm} Since 2017, child restraint systems are the only form of restraint allowed for children under 7 years old (before the 2017 revision, children under 12 were to be restrained either in a child restraint or by «other means»)
- ^{bn} For children aged 7-11 years old (included) sitting in the rear, child restraint or seat belt can be used
- ^{bo} Children up to 11 years old (included) while sitting in the front shall be placed in a child restraint, children aged 12 years and more can sit in the front without a child restraint
- ^{bp} Legislation refers to either child restraint or seat belt to restrain children under 12 years
- ^{bq} Except if child restraint or seat belt are available in the front seat
- ^{br} Legislation refers to either child restraint or seat belt use to transport children
- ^{bs} Except if the vehicle does not have rear seats provided and such transportation is made in a child restraint (with airbag deactivated if a rear-facing restraint is being used)
- ^{bt} Reference is made to special seats to be used for children with no details as to the specific age / height under which children should be mandatorily placed in them
- ^{bu} Except for children under 3 years if airbag is deactivated
- ^{bv} The legislation refers to the use of child restraint systems for infant or child passenger but does not refer to a specific age/ height up to which the use of child restraint is mandatory

- ^{bw} Obligation not based on age / height or weight
- ^{bx} Obligation to place children in the rear only applies in vehicles not fitted with seat belts and having rear seats
- ^{by} Front seating for children under 135 cm is only allowed as an exception if there are no seats in the back or all other seats are occupied by children
- ^{bz} For children under 10 years, the legislation refers to the use of child restraint system (CRS) where available and appropriate, and specifies that in the absence of child restraint, seat belts are to be used
- ^{ca} Children under 12 years and less than 150 cm shall be placed in a child restraint
- ^{cb} Legislation refers to the use of child restraints or «other means» to secure children up to 12 years old but allows the transport of children under 12 years on the knees of an adult passenger seated in the back with the seat belt fastened
- ^{cc} Front seating of children under 12 years allowed if a child restraint is being used
- ^{cd} Except for children under 2 years in a rear-facing child restraint if airbag is deactivated
- ^{ce} Unless the vehicle does not have a back seat and such transportation is carried out by using an approved child restraint, appropriate to the child's size and weight
- ^{cf} Child restraints are required for children under 150 cm, by exception, children of height 135-150 cm can be restrained with a seat belt only if they sit in the back
- ^{cg} Special seating equipment for children under 12 years is only mentioned only in relation with front seating
- ^{ch} Law does not specifically refer to child restraint system but to «special seating equipment» for children under 12 years
- ^{ci} The legislation refers to the use of «special means» to be used in conjunction with the seat belt to restraint children under 12 years and 145 cm
- ^{cj} No specific reference to child restraint but to «special means» for children under 145 cm and 12 years sitting in the front
- ^{ck} Child restraints are required for children aged 4 and below
- ^{cl} Child restraint laws are enacted at subnational level. While all states require the use of child restraints, they provide different age / weight / height criteria to specify the period for mandatory use of child restraints/ booster seats
- ^{cm} Legislation allows that infants (defined as children under 3 years) be held by a responsible person as an alternative to using special seats
- ^{cn} Infant (defined as children under 3 years) shall be placed in a restraining seat while travelling in the front
- ^{co} The law requires «infants» to use «special seats for that purpose» but does not specify the age for children falling into the «infants» category
- ^{cp} Law refers to a device of the type validated by the licensing authority to restraint children under 14 years

^a Only for new models

^b For new models as from 2018

^c Mandatory as from 2018 under voluntary agreement with car makers but postponed to 2022 by the new government following Brazil ESC mandatory date

^d Australia has signed the UN127 for Pedestrian Protection as a Contracting Party but is not enforcing it

^e Brazil included the requirement for side impact for new vehicles from 2020

^f However top 12 car makers (more than 70% of sales volume) committed to ESC standard as from 2018

^g Mandatory from October 2018

^h Required for cars made under US regulations - for European cars, no requirements further than ESC

ⁱ For new models as from 2018

^j According to representatives information the regulation will be mandatory as from 2020

^k Thailand launched an ECO-CAR program with tax incentives for cars with ESC but this is not mandatory for all cars
